DevOps Institute's SKIL Framework

DevOps Institute is dedicated to advancing the human elements of DevOps success through our human-centered SKIL framework of Skills, Knowledge, Ideas and Learning.

We develop, accredit and orchestrate SKIL through certifications, research, learning opportunities, events and community connections.

Visit the
SKILupSM
CAFE

at www.devopsinstitute.com to learn more.

Join Us!

Become a member and join the fastest growing global community of DevOps practitioners and professionals.

The DevOps Institute continuous learning community is your go-to hub for all things DevOps, so get ready to learn, engage, and inspire.

Visit <https://www.devopsinstitute.com/become-a-community-member> to join today.

You belong.

DevOps Institute is dedicated to advancing the human elements of DevOps success. We fulfill our mission through our SKIL framework of Skills, Knowledge, Ideas and Learning.

Certification is one means of showcasing your skills. While we strongly support formal training as the best learning experience and method for certification preparation, DevOps Institute also recognizes that humans learn in different ways from different resources and experiences. As the defacto certification body for DevOps, DevOps Institute has now removed the barrier to certification by removing formal training prerequisites and opening our testing program to anyone who believes that they have the topical knowledge and experience to pass one or more of our certification exams.

This examination study guide will help test-takers prepare by defining the scope of the exam and includes the following:

- Course Description
- Examination Requirements
- DevOps Glossary of Terms
- Value Added Resources
- Sample Exam(s) with Answer Key

These assets provide a guideline for the topics, concepts, vocabulary and definitions that the exam candidate is expected to know and understand in order to pass the exam. The knowledge itself will need to be gained on its own or through training by one of our Global Education Partners.

Test-takers who successfully pass the exam will also receive a certificate and digital badge from DevOps Institute, acknowledging their achievement, that can be shared with their professional online networks.

If you have any questions, please contact our DevOps Institute Customer Service team at CustomerService@DevOpsInstitute.com.

DevOps Foundation®

Wymagania egzaminacyjne

Certyfikat DevOps Foundation®

DevOps Foundation to niezależna certyfikacja od DevOps Institute. Celem tego kursu i związanego z nim egzaminu jest przekazanie, przetestowanie i weryfikacja wiedzy na temat podstawowych pojęć, zasad i praktyk DevOps. Definicje, koncepcje i praktyki DevOps są udokumentowane w podręczniku uczestnika szkolenia. Kurs DevOps Foundation ma na celu zapewnienie uczestnikom zrozumienia podstawowych pojęć DevOps oraz tego, w jaki sposób DevOps może być użyty do poprawy komunikacji, współdziałania i integracji między twórcami oprogramowania i specjalistami od operacji IT.

Wymagania egzaminacyjne

Chociaż nie ma formalnych warunków wstępnych do egzaminu, DevOps Institute zdecydowanie zaleca kandydatom do egzaminu DevOps Foundation co następuje:

- Zaleca się, aby kandydaci ukończyli co najmniej 16-godzinne formalne, akredytowane szkolenie, przeprowadzone przez Zarejestrowanego Partnera Edukacyjnego (REP) zatwierdzonego przez DevOps Institute;
- Zaleca się, aby kandydaci przeznaczili co najmniej 6 godzin na naukę własną, przeglądając listę pojęć i odpowiednie obszary podręcznika szkolenia oraz wypełniając przykładowe egzaminy próbne.

Organizacja egzaminu

Egzamin DevOps Foundation jest akredytowany, zarządzany i administrowany zgodnie ze ścisłymi zasadami zdefiniowanymi przez DevOps Institute.

Poziom trudności

Certyfikacja DevOps Foundation wykorzystuje taksonomię celów nauczania Blooma zarówno w odniesieniu do zawartości merytorycznej szkolenia, jak i egzaminu:

- Egzamin DevOps Foundation zawiera pytania na poziomie Bloom 1, które sprawdzają **wiedzę** uczestników na temat koncepcji DevOps i terminologii (patrz lista poniżej);
- Egzamin zawiera również pytania na poziomie Bloom 2, które sprawdzają **rozumienie** tych pojęć przez uczestników w podanym kontekście.

Format egzaminu

Kandydaci muszą uzyskać pozytywny wynik na egzaminie, aby uzyskać certyfikat DevOps Foundation.

| | |
|-------------------|---|
| Typ egzaminu | 40 pytań jednokrotnego wyboru (1 prawidłowa odpowiedź z 4) |
| Czas trwania | 60 minut |
| Wymagania wstępne | Zaleca się, aby kandydaci ukończyli kurs DevOps Foundation od Zarejestrowanego Partnera Edukacyjnego DevOps Institute (REP) |
| Nadzór | Nie |
| Otwarte książki | Tak |
| Próg zdawalności | 65% |
| Sposób realizacji | Strona internetowa |
| Odznaka | DevOps Foundation Certified |

Obszary merytoryczne na egzaminie i waga pytań

Egzamin DevOps Foundation wymaga znajomości obszarów merytorycznych opisanych poniżej.

| Moduł | Opis | Maksymalna liczba pytań |
|--|--|-------------------------|
| DOFD – 1 Exploring DevOps | Purpose, objectives and business value of DevOps | 5 |
| DOFD – 2 Core DevOps Principles | The Three Ways | 4 |
| DOFD – 3 Key DevOps Practices | Emerging DevOps Practices such as continuous delivery and continuous integration | 7 |
| DOFD – 4 Business & Technology Frameworks | The relationship between relevant frameworks and standards and DevOps | 7 |
| DOFD – 5 DevOps Values - Culture, Behaviors & Operating Models | Characteristics of a DevOps culture and of culture change | 6 |
| DOFD – 6 DevOps Values - Automation & Architecting DevOps Toolchains | The Deployment Pipeline, DevOps toolchains and other automation considerations | 5 |
| DOFD – 7 DevOps Values – Measurement, Metrics & Reporting | Common DevOps practices and related processes | 2 |
| DOFD – 8 DevOps Values: Sharing, Shadowing and Reporting | Responsibilities of key roles and considerations relative to organizational structure. Getting started - adoption challenges, risks, critical success factors and key performance measures | 4 |

Lista pojęć i definicji

Po ukończeniu kursu DevOps Foundation od kandydata oczekuje się zrozumienia następujących pojęć i definicji DevOps na poziomie Bloom 1 i 2.

- Agile Manifesto
- Agile service management
- Agile software development
- Application Programming Interface (API)
- CALMS
- Change failure rate
- Change fatigue
- Change lead time
- ChatOps
- Code commit
- Collaboration and communication
- Collective Body of Knowledge (CBOK)
- Constraint
- Containers
- Continuous integration
- Continuous delivery
- Continuous deployment
- Continuous Testing
- Cultural debt
- Cycle time
- Deployment pipeline
- Deployment frequency
- DevSecOps
- DevOps
- DevOps metrics
- DevOps stakeholders
- DevOps teams
- DevOps roles
- Dojo
- employee Net Promoter Score (eNPS)
- Epics
- Flow
- Golden Circle
- High-performing organizations
- Impediment
- Immersion
- Improvement kata
- IT service management
- Kanban
- Kubernetes
- Kubler-Ross Change Curve
- Lean production
- Lean thinking
- Lean tools
- Lean types of Waste (DOWNTIME)
- Mean Time to Repair/Recover (MTTR)
- Microservices
- Open source
- Organizational culture
- Organizational considerations
- Resilience Engineering
- Scaled Agile Framework (SAFe)
- Scrum
- Scrum roles, artifacts and events
- Service
- Shift left
- Simian Army/Chaos Monkey
- Single Point of Failure (SPOF)
- Test driven development
- Testing (unit, acceptance, integration)
- The Three Ways
- Theory of Constraints
- Thomas-Kilmann Conflict Modes
- DevOps toolchain
- Value stream mapping
- Velocity
- Waste
- Waterfall

DevOps
INSTITUTE

DEVOPS

GLOSSARY OF TERMS

This glossary is provided for reference only as it contains key terms that may or may not be examinable.

DevOps Glossary of Terms

| Term | Definition | Course Appearances |
|-----------------------------------|---|--|
| 12-Factor App Design | A methodology for building modern, scalable, maintainable software-as-a-service applications. | Continuous Delivery Ecosystem Foundation |
| 2-Factor or 2-Step Authentication | Two-Factor Authentication, also known as 2FA or TFA or Two-Step Authentication is when a user provides two authentication factors; usually firstly a password and then a second layer of verification such as a code texted to their device, shared secret, physical token or biometrics. | DevSecOps Foundation |
| A/B Testing | Deploy different versions of an EUT to different customers and let the customer feedback determine which is best. | Continuous Delivery Ecosystem Foundation |
| A3 Problem Solving | A structured problem-solving approach that uses a lean tool called the A3 Problem-Solving Report. The term "A3" represents the paper size historically used for the report (a size roughly equivalent to 11" x 17"). | DevOps Foundation |
| Access Management | Granting an authenticated identity access to an authorized resource (e.g., data, service, environment) based on defined criteria (e.g., a mapped role), while preventing an unauthorized identity access to a resource. | DevSecOps Foundation |
| Access Provisioning | Access provisioning is the process of coordinating the creation of user accounts, e-mail authorizations in the form of rules and roles, and other tasks such as provisioning of physical resources associated with enabling new users to systems or environments. | DevSecOps Foundation |
| Administration Testing | The purpose of the test is to determine if an End User Test (EUT) is able to process administration tasks as expected. | Continuous Delivery Ecosystem Foundation |

| | | |
|----------------------------|--|--|
| Advice Process | Any person making a decision must seek advice from everyone meaningfully affected by the decision and people with expertise in the matter. Advice received must be taken into consideration, though it does not have to be accepted or followed. The objective of the advice process is not to form consensus, but to inform the decision-maker so that they can make the best decision possible. Failure to follow the advice process undermines trust and unnecessarily introduces risk to the business. | DevSecOps Foundation |
| Agile | A project management method for complex projects that divides tasks into small "sprints" of work with frequent reassessment and adaptation of plans. | Certified Agile Process Owner, Certified Agile Service Manager, Site Reliability Engineering |
| Agile (adjective) | Able to move quickly and easily; well-coordinated. Able to think and understand quickly; able to solve problems and have new ideas. | DevOps Foundation, DevSecOps Foundation |
| Agile Coach | Help teams master Agile development and DevOps practices; enables productive ways of working and collaboration. | DevOps Leader |
| Agile Enterprise | Fast moving, flexible and robust company capable of rapid response to unexpected challenges, events, and opportunities. | DevOps Foundation, DevSecOps Foundation |
| Agile Manifesto | A formal proclamation of values and principles to guide an iterative and people-centric approach to software development. http://agilemanifesto.org | DevOps Foundation |
| Agile Portfolio Management | Involves evaluating in-flight projects and proposed future initiatives to shape and govern the ongoing investment in projects and discretionary work. CA's Agile Central and VersionOne are examples. | Site Reliability Engineering |
| Agile Principles | The twelve principles that underpin the Agile Manifesto. | Certified Agile Service Manager |
| Agile Process Design | The aspect of Agile Service Management (Agile SM) that applies the same Agile approach to process design as developers do to software development. | Certified Agile Service Manager |
| Agile Process Improvement | The aspect of Agile SM that aligns Agile values with ITSM processes through continuous improvement. | Certified Agile Service Manager |

| | | |
|------------------------------------|--|---|
| Agile Process Owner | An ITSM or other type of process owner that uses Agile and Scrum principles and practices to design, manage and measure individual processes. | DevOps Foundation |
| Agile Service Management | Framework that ensures that ITSM processes reflect Agile values and are designed with "just enough" control and structure in order to effectively and efficiently deliver services that facilitate customer outcomes when and how they are needed. | Certified Agile Service Manager |
| Agile Service Management Artifacts | Process Backlog, Sprint Backlog, Burndown Chart, Process Increment | Certified Agile Process Owner |
| Agile Service Management Events | Process Planning Meeting (optional), Sprint Planning Meeting, Sprint, Daily Scrum, Sprint Review, Sprint Retrospective | Certified Agile Process Owner |
| Agile Service Management Roles | Process Owner, Process Improvement Team (Team) and Agile Service Manager. See also Scrum Roles. | Certified Agile Process Owner |
| Agile Service Manager | The operational equivalent to Dev's ScrumMaster. A role within an IT organization that understands how to leverage Agile and Scrum methods to improve the design, speed and agility of ITSM processes. | DevOps Foundation |
| Agile Software Development | Group of software development methods in which requirements and solutions evolve through collaboration between self-organizing, cross-functional teams. Usually applied using the Scrum or Scaled Agile Framework approach. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation |
| Amazon Web Services (AWS) | Amazon Web Services (AWS) is a secure cloud services platform, offering compute power, database storage, content delivery and other functionality to help businesses scale and grow. | DevSecOps Foundation, Site Reliability Engineering |
| Analytics | Test results processed and presented in an organized manner in accordance with analysis methods and criterion. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Andon | A system gives an assembly line worker the ability, and moreover the empowerment, to stop production when a defect is found, and immediately call for assistance. | Continuous Delivery Ecosystem Foundation |
| Anti-pattern | A commonly reinvented but poor solution to a problem. | DevOps Foundation |

| | | |
|---|--|---|
| Anti-fragility | Antifragility is a property of systems that increases its capability to thrive as a result of stressors, shocks, volatility, noise, mistakes, faults, attacks, or failures. | DevOps Foundation, Site Reliability Engineering |
| API Testing | The purpose of the test is to determine if an API for an EUT functions as expected. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Application Performance Management (APM) | APM is the monitoring and management of performance and availability of software applications. APM strives to detect and diagnose complex application performance problems to maintain an expected level of service. | Site Reliability Engineering |
| Application Programming Interface (API) | A set of protocols used to create applications for a specific OS or as an interface between modules or applications. | DevOps Foundation, DevSecOps Foundation |
| Application Programming Interface (API) Testing | The purpose of the test is to determine if an API for an EUT functions as expected. | Continuous Delivery Ecosystem Foundation |
| Application Release | Controlled continuous delivery pipeline capabilities including automation (release upon code commit). | Continuous Delivery Ecosystem Foundation |
| Application Release Automation (ARA) or Orchestration (ARO) | Controlled continuous delivery pipeline capabilities including automation (release upon code commit), environment modeling (end-to-end pipeline stages, and deploy application binaries, packages or other artifacts to target environments) and release coordination (project, calendar and scheduling management, integrate with change control and/or IT service support management). | Continuous Delivery Ecosystem Foundation |
| Application Test Driven Development (ATDD) | Acceptance Test Driven Development (ATDD) is a practice in which the whole team collaboratively discusses acceptance criteria, with examples, and then distills them into a set of concrete acceptance tests before development begins. | Continuous Delivery Ecosystem Foundation |
| Application Testing | The purpose of the test is to determine if an application is performing according to its requirements and expected behaviors. | Continuous Delivery Ecosystem Foundation |

| | | |
|------------------------------|---|--|
| Application Under Test (AUT) | The EUT is a software application. E.g. Business application is being tested. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Architecture | The fundamental underlying design of computer hardware, software or both in combination. | DevSecOps Foundation |
| Artifact | Any element in a software development project including documentation, test plans, images, data files and executable modules. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation |
| Artifact Repository | Store for binaries, reports and metadata. Example tools include: JFrog Artifactory, Sonatype Nexus. | Continuous Delivery Ecosystem Foundation, DevOps Foundation |
| Attack path | The chain of weaknesses a threat may exploit to achieve the attacker's objective. For example, an attack path may start by compromising a user's credentials, which are then used in a vulnerable system to escalate privileges, which in turn is used to access a protected database of information, which is copied out to an attacker's own server(s). | DevSecOps Foundation |
| Audit Management | The use of automated tools to ensure products and services are auditable, including keeping audit logs of build, test and deploy activities, auditing configurations and users, as well as log files from production operations. | Site Reliability Engineering |
| Authentication | The process of verifying an asserted identity. Authentication can be based on what you know (e.g., password or PIN), what you have (token or one-time code), what you are (biometrics) or contextual information. | DevSecOps Foundation |
| Authorization | The process of granting roles to users to have access to resources. | DevSecOps Foundation |
| Auto-DevOps | Auto DevOps brings DevOps best practices to your project by automatically configuring software development lifecycles. It automatically detects, builds, tests, deploys, and monitors applications. | Site Reliability Engineering |
| Auto-scaling | The ability to automatically and elastically scale and de-scale infrastructure depending on traffic and capacity variations while maintaining control of costs. | Continuous Delivery Ecosystem Foundation |

| | | |
|-----------------------------------|---|---|
| Automated rollback | If a failure is detected during a deployment, an operator (or an automated process) will verify the failure and rollback the failing release to the previous known working state. | Site Reliability Engineering |
| Availability | Availability is the proportion of time a system is in a functioning condition and therefore available (to users) to be used. | Site Reliability Engineering |
| Backdoor | A backdoor bypasses the usual authentication used to access a system. Its purpose is to grant the cybercriminals future access to the system even if the organization has remediated the vulnerability initially used to attack the system. | DevSecOps Foundation |
| Backlog | Requirements for a system, expressed as a prioritized list of product backlog items usually in the form of 'User Stories'. The product backlog is prioritized by the Product Owner and should include functional, non-functional and technical team-generated requirements. | Continuous Delivery Ecosystem Foundation, DevOps Foundation |
| Basic Security Hygiene | A common set of minimum-security practices that must be applied to all environments without exception. Practices include basic network security (firewalls and monitoring), hardening, vulnerability and patch management, logging and monitoring, basic policies and enforcement (may be implemented under a "policies as code" approach), and identity and access management. | DevSecOps Foundation |
| Batch Sizes | Refers to the volume of features involved in a single code release. | DevOps Leader |
| Bateson Stakeholder Map | A tool for mapping stakeholder's engagement with the initiative in progress. | DevOps Leader |
| Behavior Driven Development (BDD) | Test cases are created by simulating an EUT's externally observable inputs, and outputs. Example tool: Cucumber. | Continuous Delivery Ecosystem Foundation |
| Beyond Budgeting | A management model that looks beyond command-and-control towards a more empowered and adaptive state. | DevOps Leader |
| Black-Box | Test case only uses knowledge of externally observable behaviors of an EUT. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|-----------------------------------|---|---|
| Blameless post mortems | A process through which engineers whose actions have contributed to a service incident can give a detailed account of what they did without fear of punishment or retribution. | Site Reliability Engineering |
| Blast Radius | Used for impact analysis of service incidents. When a particular IT service fails, the users, customers, other dependent services that are affected. | Site Reliability Engineering |
| Blue/Green Testing or Deployments | Taking software from the final stage of testing to live production using two environments labelled Blue and Green. Once the software is working in the green environment, switch the router so that all incoming requests go to the green environment - the blue one is now idle. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Bug | An error or defect in software that results in an unexpected or system-degrading condition. | DevSecOps Foundation |
| Bureaucratic Culture | Bureaucratic organizations are likely to use standard channels or procedures which may be insufficient in a crisis (Westrum). | DevOps Leader |
| Burndown Chart | Chart showing the evolution of remaining effort against time. | Certified Agile Service Manager, DevOps Foundation |
| Bursting | Public cloud resources are added as needed to temporarily increase the total computing capacity of a private cloud. | Continuous Delivery Ecosystem Foundation |
| Business Case | Justification for a proposed project or undertaking on the basis of its expected commercial benefit. | DevOps Leader |
| Business Continuity | Business continuity is an organization's ability to ensure operations and core business functions are not severely impacted by a disaster or unplanned incident that take critical services offline. | Site Reliability Engineering |
| Business Transformation | Changing how the business functions. Making this a reality means changing culture, processes, and technologies in order to better align everyone around delivering on the organization's mission. | DevSecOps Foundation |
| Business Value | The benefit of an approach to key business KPIs. | DevOps Leader |

| | | |
|---------------------------------|--|--|
| Cadence | Flow or rhythm of events. | DevOps Foundation, DevOps Leader, DevSecOps Foundation |
| CALMS Model | Considered the pillars or values of DevOps: Culture, Automation, Lean, Measurement, Sharing (as put forth by John Willis, Damon Edwards and Jez Humble). | DevOps Foundation |
| Canary Testing | A canary (also called a canary test) is a push of code changes to a small number of end users who have not volunteered to test anything. Similar to incremental rollout, it is where a small portion of the user base is updated to a new version first. This subset, the canaries, then serve as the proverbial "canary in the coal mine". If something goes wrong then a release is rolled back and only a small subset of the users are impacted. | Continuous Delivery Ecosystem Foundation, Site Reliability Engineering |
| Capacity Test | The purpose of the test is to determine if the EUT can handle expected loads such as number of users, number of sessions, aggregate bandwidth. | Continuous Delivery Ecosystem Foundation |
| Capture-Replay | Test cases are created by capturing live interactions with the EUT, in a format that can be replayed by a tool. E.g. Selenium | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Carrots | Positive incentives, for encouraging and rewarding desired behaviors. | DevSecOps Foundation |
| Chain of Goals | A method designed by Roman Pichler of ensuring that goals are linked and shared at all levels through the product development process. | DevOps Leader |
| Change | Addition, modification or removal of anything that could have an effect on IT services. (ITIL® definition) | DevOps Foundation, DevSecOps Foundation |
| Change Failure Rate | A measure of the percentage of failed/rolled back changes. | Continuous Delivery Ecosystem Foundation, DevOps Foundation |
| Change Fatigue | A general sense of apathy or passive resignation towards organizational changes by individuals or teams. | DevSecOps Foundation |
| Change Lead Time | A measure of the time from a request for change to delivery of the change. | DevOps Foundation |
| Change Leader Development Model | Jim Canterucci's model for five levels of change leader capability. | DevOps Leader |

| | | |
|------------------------------------|---|--|
| Change Management | Process that controls all changes throughout their lifecycle. (ITIL definition) | DevOps Foundation, DevOps Leader, DevSecOps Foundation |
| Change Management (Organizational) | An approach to shifting or transitioning individuals, teams & organizations from a current state to a desired future state. Includes the process, tools & techniques to manage the people-side of change to achieve the required business outcome(s). | DevOps Leader |
| Change-based Test Selection Method | Tests are selected according to a criterion that matches attributes of tests to attributes of the code that is changed in a build. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Chaos Engineering | The discipline of experimenting on a software system in production in order to build confidence in the system's capability to withstand turbulent and unexpected conditions. | Site Reliability Engineering |
| Chapter Lead | A squad line manager in the Spotify model who is responsible for traditional people management duties, is involved in day to day work and grows individual and chapter competence. | DevOps Leader |
| Chapters | A small family of people having similar skills and who work within the same general competency area within the same tribe. Chapters meet regularly to discuss challenges and areas of expertise in order to promote sharing, skill development, re-use and problem solving. | DevOps Leader |
| ChatOps | An approach to managing technical and business operations (coined by GitHub) that involves a combination of group chat and integration with DevOps tools. Example tools include: Atlassian HipChat/Stride, Microsoft Teams, Slack. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, Continuous Testing Foundation, Site Reliability Engineering |
| Check-in | Action of submitting a software change into a system version management system. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| CI Regression Test | A subset of regression tests that are run immediately after a software component is built. Same as Smoke Test. | Continuous Delivery Ecosystem Foundation |

| | | |
|---------------------------|--|---|
| Clear-Box | Same as Glass-Box Testing and White-Box Testing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Cloud Computing | The practice of using remote servers hosted on the internet to host applications rather than local servers in a private datacenter. | DevSecOps Foundation, Site Reliability Engineering |
| Cloud-Native | Native cloud applications (NCA) are designed for cloud computing. | Continuous Delivery Ecosystem Foundation |
| Cloudbees | Cloudbees is a commercially supported proprietary automation framework tool which works with and enhances Jenkins by providing enterprise levels support and add-on functionality. | Continuous Testing Foundation |
| Cluster Cost Optimization | Tools like Kubecost, Replex, Cloudability use monitoring to analyze container clusters and optimize the resource deployment model. | Site Reliability Engineering |
| Cluster Monitoring | Tools that let you know the health of your deployment environments running in clusters such as Kubernetes. | Site Reliability Engineering |
| Clustering | A group of computers (called nodes or members) work together as a cluster connected through a fast network acting as a single system. | Continuous Delivery Ecosystem Foundation |
| Code Coverage | A measure of white box test coverage by counting code units that are executed by a test. The code unit may be a code statement, a code branch, or control path or data path through a code module. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Code Quality | See also static code analysis, Sonar and Checkmarks are examples of tools that automatically check the seven main dimensions of code quality – comments, architecture, duplication, unit test coverage, complexity, potential defects, language rules. | Site Reliability Engineering |
| Code Repository | A repository where developers can commit and collaborate on their code. It also tracks historical versions and potentially identifies conflicting versions of the same code. Also referred to as "repository" or "repo." | DevSecOps Foundation |
| Code Review | Software engineers inspect each other's source code to detect coding or code formatting errors. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|----------------------------|--|---|
| Cognitive Bias | Cognitive bias is a limitation in objective thinking that is caused by the tendency for the human brain to perceive information through a filter of personal experience and preferences: a systematic pattern of deviation from norm or rationality in judgment. | DevOps Leader |
| Collaboration | People jointly working with others towards a common goal. | DevOps Foundation, DevSecOps Foundation |
| Collaborative Culture | A culture that applies to everyone which incorporates an expected set of behaviors, language and accepted ways of working with each other reinforcement by leadership. | Continuous Delivery Ecosystem Foundation |
| Compatibility Test | Test with the purpose to determine if and EUT interoperates with another EUT such as peer-to-peer applications or protocols. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Configuration Management | Configuration management (CM) is a systems engineering process for establishing and maintaining consistency of a product's performance, functional, and physical attributes with its requirements, design, and operational information throughout its life. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation |
| Conformance Test | The purpose of the test is to determine if an EUT complies to a standard. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Constraint | Limitation or restriction; something that constrains. See also <i>bottleneck</i> . | DevOps Foundation, DevSecOps Foundation |
| Container | A way of packaging software into lightweight, stand-alone, executable packages including everything needed to run it (code, runtime, system tools, system libraries, settings) for development, shipment and deployment. | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Container Network Security | Used to prove that any app that can be run on a container cluster with any other app can be confident that there is no unintended use of the other app or any unintended network traffic between them. | Site Reliability Engineering |

| | | |
|-------------------------------------|---|---|
| Container Registry | Secure and private registry for Container images. Typically allowing for easy upload and download of images from the build tools. Docker Hub, Artifactory, Nexus are examples. | Site Reliability Engineering |
| Container Scanning | When building a Container image for your application, tools can run a security scan to ensure it does not have any known vulnerability in the environment where your code is shipped. Blackduck, Synopsys, Synk, Claire and klar are examples. | Site Reliability Engineering |
| Continual Service Improvement (CSI) | One of the ITIL Core publications and a stage of the service lifecycle. | DevOps Foundation |
| Continuous Delivery (CD) | A methodology that focuses on making sure software is always in a releasable state throughout its lifecycle. | Certified Agile Service Manager, Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation, Continuous Testing Foundation |
| Continuous Delivery (CD) Architect | A person who is responsible to guide the implementation and best practices for a continuous delivery pipeline. | Continuous Delivery Ecosystem Foundation |
| Continuous Delivery Pipeline | A continuous delivery pipeline refers to the series of processes which are performed on product changes in stages. A change is injected at the beginning of the pipeline. A change may be new versions of code, data or images for applications. Each stage processes the artifacts resulting from the prior stage. The last stage results in deployment to production. | Continuous Delivery Ecosystem Foundation, DevOps Foundation Course, DevOps Leader |
| Continuous Delivery Pipeline Stage | Each process in a continuous delivery pipeline. These are not standard. Examples are Design: determine implementation changes; Creation: implement an unintegrated version of design changes; Integration: merge | Continuous Delivery Ecosystem Foundation |
| Continuous Deployment | A set of practices that enable every change that passes automated tests to be automatically deployed to production. | DevOps Foundation, DevSecOps Foundation |
| Continuous Flow | Smoothly moving people or products from the first step of a process to the last with minimal (or no) buffers between steps. | DevOps Foundation, DevOps Leader, DevSecOps Foundation |

| | | |
|-------------------------------|---|---|
| Continuous Improvement | Based on Deming's Plan-Do-Check-Act, a model for ensure ongoing efforts to improve products, processes and services. | DevOps Foundation, DevOps Leader |
| Continuous Integration (CI) | A development practice that requires developers to merge their code into trunk or master ideally at least daily and perform tests (i.e. unit, integration and acceptance) at every code commit. | Certified Agile Service Manager, Continuous Delivery Ecosystem Foundation, DevOps Foundation, Continuous Testing Foundation, DevSecOps Foundation |
| Continuous Integration Tools | Tools that provide an immediate feedback loop by regularly merging, building and testing code. Example tools include: Atlassian Bamboo, Jenkins, Microsoft VSTS/Azure DevOps, TeamCity. | DevOps Foundation, DevOps Leader |
| Continuous Monitoring (CM) | This is a class of terms relevant to logging, notifications, alerts, displays and analysis of test results information. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Continuous Testing (CT) | This is a class of terms relevant to testing and verification of an EUT in a DevOps environment. | DevOps Foundation, Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Conversation Café | Conversation Cafés are open, hosted conversations in cafés as well as conferences and classrooms—anywhere people gather to make sense of our world. | DevOps Leader |
| Conway's Law | Organizations which design systems are constrained to produce designs which are copies of the communication structures of these organizations. | Continuous Delivery Ecosystem Foundation, DevOps Leader |
| Cooperation vs. Competition | The key cultural value shift toward being highly collaborative and cooperative, and away from internal competitiveness and divisiveness. | DevSecOps Foundation |
| COTS | Commercial-off-the-shelf solution | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Critical Success Factor (CSF) | Something that must happen for an IT service, process, plan, project or other activity to succeed. | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation, DevSecOps Foundation |

| | | |
|--------------------------------------|---|---|
| CSI Register | Vehicle for recording and managing improvement opportunities throughout their lifecycle (Continual Service Improvement). | Certified Agile Service Manager |
| Cultural Iceberg | A metaphor that visualizes the difference between observable (above the water) and non-observable (below the waterline) elements of culture. | DevOps Leader |
| Culture (Organizational Culture) | The values and behaviors that contribute to the unique psychosocial environment of an organization. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation |
| Cumulative Flow Diagram | A cumulative flow diagram is a tool used in agile software development and lean product development. It is an area graph that depicts the quantity of work in a given state, showing arrivals, time in queue, quantity in queue, and departure. | DevOps Leader |
| Current State Map | A form of value stream map that helps you identify how the current process works and where the disconnects are. | DevOps Leader |
| Customer Reliability Engineer (CRE) | CRE is what you get when you take the principles and lessons of SRE and apply them towards customers. | Site Reliability Engineering |
| Cycle Time | A measure of the time from start of work to ready for delivery. | DevOps Foundation, DevOps Leader, DevSecOps Foundation |
| Daily Scrum | Daily timeboxed event of 15 minutes or less for the Team to replan the next day of work during a Sprint. | Certified Agile Service Manager, DevOps Foundation |
| Dashboard | Graphical display of summarized test results. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Data Loss Protection (DLP) | Tools that prevent files and content from being removed from within a service environment or organization. | Site Reliability Engineering |
| Database Reliability Engineer (DBRE) | A person responsible for keeping database systems that support all user facing services in production running smoothly. | Site Reliability Engineering |
| Defect Density | The number of faults found in a unit E.g. # defects per KLOC, # defects per change. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|------------------------|---|--|
| Definition of Done | A shared understanding of expectations that the Increment must live up to in order to be releasable into production. (Scrum.org) | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation, DevOps Leader |
| Delivery Cadence | The frequency of deliveries. E.g. # deliveries per day, per week, etc. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Delivery Package | Set of release items (files, images, etc.) that are packaged for deployment. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Deming Cycle | A four-stage cycle for process management, attributed to W. Edwards Deming. Also called Plan-Do-Check-Act (PDCA). | DevOps Foundation, DevSecOps Foundation |
| Dependency Firewall | Many projects depend on packages that may come from unknown or unverified providers, introducing potential security vulnerabilities. There are tools to scan dependencies but that is after they are downloaded. These tools prevent those vulnerabilities from being downloaded to begin with. | Site Reliability Engineering |
| Dependency Proxy | For many organizations, it is desirable to have a local proxy for frequently used upstream images/packages. In the case of CI/CD, the proxy is responsible for receiving a request and returning the upstream image from a registry, acting as a pull-through cache. | Site Reliability Engineering |
| Dependency Scanning | Used to automatically find security vulnerabilities in your dependencies while you are developing and testing your applications. Synopsis, Gemnasium, Retire.js and bundler-audit are popular tools in this area. | Site Reliability Engineering |
| Deployment | The installation of a specified version of software to a given environment (e.g., promoting a new build into production). | DevOps Foundation, DevSecOps Foundation |
| Design for Testability | An EUT is designed with features which enable it to be tested. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Design Principles | Principles for designing, organizing, and managing a DevOps delivery operating model. | DevOps Leader |

| | | |
|-------------------------|--|--|
| Dev | Individuals involved in software development activities such as application and software engineers. | DevOps Foundation, DevSecOps Foundation |
| Developer (Dev) | Individual who has responsibility to develop changes for an EUT. Alternate: Individuals involved in software development activities such as application and software engineers. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Development Test | Ensuring that the developer's test environment is a good representation of the production test environment. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Device Under Test (DUT) | The EUT is a device. E.g. Router or switch is being tested. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| DevOps | A cultural and professional movement that stresses communication, collaboration and integration between software developers and IT operations professionals while automating the process of software delivery and infrastructure changes. It aims at establishing a culture and environment where building, testing, and releasing software, can happen rapidly, frequently, and more reliably." (Source: Wikipedia) | Certified Agile Service Manager, DevOps Foundation, DevSecOps Foundation |
| DevOps Coach | Help teams master Agile development and DevOps practices; enables productive ways of working and collaboration. | DevOps Leader |
| DevOps Infrastructure | The entire set of tools and facilities that make up the DevOps system. Includes CI, CT, CM and CD tools. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| DevOps Kaizen | Kaizen is a Japanese word that closely translates to "change for better," the idea of continuous improvement—large or small—involving all employees and crossing organisational boundaries. Damon Edwards' DevOps Kaizen shows how making small, incremental improvements (little J's) has an improved impact on productivity long term. | DevOps Leader |
| DevOps Pipeline | The entire set of interconnected processes that make up a DevOps Infrastructure. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|---|--|--|
| DevOps Score | A metric showing DevOps adoption across an organization and the corresponding impact on delivery velocity. | Site Reliability Engineering |
| DevOps Toolchain | The tools needed to support a DevOps continuous development and delivery cycle from idea to value realisation. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation, Continuous Testing Foundation |
| DevSecOps | A mindset that "everyone is responsible for security" with the goal of safely distributing security decisions at speed and scale to those who hold the highest level of context without sacrificing the safety required. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation |
| Distributed Version Control System (DVCS) | The software revisions are stored in a distributed revision control system (DRCS), also known as a distributed version control system (DVCS). | Continuous Delivery Ecosystem Foundation |
| DMZ (De-Militarized Zone) | A DMZ in network security parlance is a network zone in between the public internet and internal protected resources. Any application, server, or service (including APIs) that need to be exposed externally are typically placed in a DMZ. It is not uncommon to have multiple DMZs in parallel. | DevSecOps Foundation |
| Dojo | A place where DevOps team members go for hands-on training. The team is self-organizing, which means that members will first work together to figure out what skills they will need to accomplish a desired goal and then plan together how to build those skills. | DevOps Foundation |
| Dynamic Analysis | Dynamic analysis is the testing of an application by executing data in real-time with the objective of detecting defects while it is in operation, rather than by repeatedly examining the code offline. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Dynamic Application Security Testing (DAST) | A type of testing that runs against built code to test exposed interfaces. | DevSecOps Foundation |
| EggPlant | Automated function and regression testing of enterprise applications. Licensed by Test Plant. | Continuous Testing Foundation |

| | | |
|---|--|---|
| Elastic Infrastructure | Elasticity is a term typically used in cloud computing, to describe the ability of an IT infrastructure to quickly expand or cut back capacity and services without hindering or jeopardizing the infrastructure's stability, performance, security, governance or compliance protocols. | Continuous Delivery Ecosystem Foundation |
| Elevator Pitch | A short summary used to quickly and simply define a process, product, service, organization, or event and its value proposition. | Certified Agile Process Owner |
| Empirical Process Control | Process control model in which decisions are made based on observation and experimentation (rather than on detailed upfront planning) and decisions are based on what is known. | Certified Agile Process Owner |
| eNPS | Employee Net Promoter Score (eNPS) is a way for organizations to measure employee loyalty. The Net Promoter Score, originally a customer service tool, was later used internally on employees instead of customers. | DevOps Foundation, DevOps Leader |
| Entity Under Test (EUT) | This is a class of terms which refers to names of types of entities that are being tested. These terms are often abbreviated to the form xUT where "x" represents a type of entity under test. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Epic | A big chunk of work, made up of a number of user stories, with a common objective. | Certified Agile Process Owner |
| Erickson (Stages of Psychosocial Development) | Erik Erikson (1950, 1963) proposed a psychoanalytic theory of psychosocial development comprising eight stages from infancy to adulthood. During each stage, the person experiences a psychosocial crisis which could have a positive or negative outcome for personality development. | DevSecOps Foundation |
| Error Budget | The error budget provides a clear, objective metric that determines how unreliable a service is allowed to be within a specific time period. | Site Reliability Engineering |
| Error Budget Policies | An error budget policy enumerates the activity a team takes when they've exhausted their error budget for a particular service in a particular time period. | Site Reliability Engineering |

| | | |
|---------------------|--|--|
| Error Tracking | Tools to easily discover and show the errors that application may be generating, along with the associated data. | Site Reliability Engineering |
| External Automation | Scripts and automation outside of a service that is intended to reduce toil. | Site Reliability Engineering |
| Fail Early | A DevOps tenet referring to the preference to find critical problems as early as possible in a development and delivery pipeline. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Fail Often | A DevOps tenet which emphasizes a preference to find critical problems as fast as possible and therefore frequently. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Failure Rate | Fail verdicts per unit of time. | DevOps Foundation, Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| False Negative | A test incorrectly reports a verdict of "fail" when the EUT actually passed the purpose of the test. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| False Positive | A test incorrectly reports a verdict of "pass" when the EUT actually failed the purpose of the test. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Feature Toggle | The practice of using software switches to hide or activate features. This enables continuous integration and testing a feature with selected stakeholders. | DevOps Foundation, Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Federated Identity | A central identity used for access to a wide range of applications, systems, and services, but with a particular skew toward web-based applications. Also, often referenced as Identity-as-a-Service (IDaaS). Any identity that can be reused across multiple sites, particularly via SAML or OAuth authentication mechanisms. | DevSecOps Foundation |
| Fire Drills | A planned failure testing process focussed on the operation of live services including service failure testing as well as communication, documentation, and other human factor testing. | Site Reliability Engineering |

| | | |
|-----------------------------|--|--|
| Flow | How people, products or information move through a process. Flow is the first way of The Three Ways. | DevOps Foundation, DevOps Leader, DevSecOps Foundation |
| Flow of Value | A form of map that shows the end-to-end value stream. This view is usually not available within the enterprise. | DevOps Leader |
| Framework | Backbone for plugging in tools. Launches automated tasks, collects results from automated tasks. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Freedom and Responsibility | A core cultural value that with the freedom of self-management (such as afforded by DevOps) comes the responsibility to be diligent, to follow the advice process and to take ownership of both successes and failures. | DevSecOps Foundation |
| Frequency | How often an application is released. | DevOps Leader |
| Functional Testing | Tests to determine if the functional operation of the service is as expected. | Site Reliability Engineering |
| Future State Map | A form of value stream map that helps you develop and communicate what the target end state should look like and how to tackle the necessary changes. | DevOps Leader |
| Fuzzing | Fuzzing or fuzz testing is an automated software testing practice that inputs invalid, unexpected, or random data into applications. | DevSecOps Foundation |
| Gated Commits | Define and obtain consensus for criterion of changes promoted between all CD pipeline stages such as: Dev to CI stage / CI to packaging / delivery stage / Delivery to Deployment/Production stage. | Continuous Delivery Ecosystem Foundation |
| Generative (DevOps) Culture | In a generative organization alignment takes place through identification with the mission. The individual "buys into" what he or she is supposed to do and its effect on the outcome. Generative organizations tend to be proactive in getting the information to the right people by any means. necessary. (Westrum) | DevOps Leader |
| Generativity | A cultural view wherein long-term outcomes are of primary focus, which in turn drives investments and cooperation that enable an organization to achieve those outcomes. | DevSecOps Foundation |

| | | |
|--|---|---|
| Glass-Box | Same as Clear-Box Testing and White-Box Testing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Global Process Owner | Process Owner who oversees a single, global process. A Global Process Owner (who may reside in a SMO) may oversee one or more Regional Process Managers. | Certified Agile Process Owner |
| Goal-seeking tests | The purpose of the test is to determine an EUT's performance boundaries, using incrementally stresses until the EUT reaches a peak performance. E.g. Determine the maximum throughput that can be handled without errors. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Golden Circle | A model by Simon Sinek that emphasizes an understanding of the business' "why" before focusing on the "what" and "how". | DevOps Foundation |
| Golden Image | A template for a virtual machine (VM), virtual desktop, server or hard disk drive. (TechTarget) | DevSecOps Foundation |
| Goleman's Six Styles of Leadership | Daniel Goleman (2002) created the Six Leadership Styles and found, in his research, that leaders used one of these styles at any one time. | DevOps Leader |
| Governance, Risk Management and Compliance (GRC) | A software platform intended for concentrating governance, compliance and risk management data, including policies, compliance requirements, vulnerability data, and sometimes asset inventory, business continuity plans, etc. In essence, a specialized document and data repository for security governance. Or a team of people who specialize in IT/security governance, risk management and compliance activities. Most often non-technical business analyst resources. | DevSecOps Foundation |
| Gray-Box | Test cases use a limited knowledge of the internal design structure of the EUT. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| GUI testing | The purpose of the test is to determine if the graphical user interface operates as expected. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|--------------------------------------|---|---|
| Guilds | A "community of interest" group that welcomes anyone and usually cuts across an entire organization. Similar to a Community of Practice. | DevOps Foundation, DevOps Leader |
| Hand Offs | The procedure for transferring the responsibility of a particular task from one individual or team to another. | DevOps Foundation, DevOps Leader |
| Hardening | Securing a server or infrastructure environment by removing or disabling unnecessary software, updating to known good versions of the operating system, restricting network-level access to only that which is needed, configuring logging in order to capture alerts, configuring appropriate access management and installing appropriate security tools. | DevSecOps Foundation |
| Helm Chart Registry | Helm charts are what describe related Kubernetes resources. Artifactory and Codefresh support a registry for maintaining master records of Helm Charts. | Site Reliability Engineering |
| Heritage Reliability Engineer (HRE) | Applying the principles and practices of SRE to legacy applications and environments. | Site Reliability Engineering |
| High-Trust Culture | Organizations with a high-trust culture encourage good information flow, cross-functional collaboration, shared responsibilities, learning from failures and new ideas. | DevOps Foundation |
| Horizontal Scaling | Computing resources are scaled wider to increase the volume of processing. E.g. Add more computers and run more tasks in parallel. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Idempotent | CM tools (e.g., Puppet, Chef, Ansible, and Salt) claim that they are 'idempotent' by allowing the desired state of a server to be defined as code or declarations and automate steps necessary to consistently achieve the defined state time-after-time. | Continuous Delivery Ecosystem Foundation |
| Identity | The unique name of a person, device, or the combination of both that is recognized by a digital system. Also referred to as an "account" or "user." | DevSecOps Foundation |
| Identity and Access Management (IAM) | Policies, procedures and tools for ensuring the right people have the right access to technology resources. | DevSecOps Foundation |

| | | |
|-----------------------------------|--|---|
| Identity as a Service (IDAAS) | Identity and access management services that are offered through the cloud or on a subscription basis. | DevSecOps Foundation |
| Image-based test selection method | Build images are pre-assigned test cases. Tests cases are selected for a build by matching the image changes resulting from a build. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Immersive learning | A learning approach that guides teams with coaching and practice to help them learn to work in a new way. | DevOps Leader |
| Immutable | An immutable object is an object whose state cannot be modified after it is created. The antonym is a mutable object, which can be modified after it is created. | Continuous Delivery Ecosystem Foundation |
| Immutable Infrastructures | Instead of instantiating an instance (server, container, etc.), with error-prone, time-consuming patches and upgrades (i.e. mutations), replace it with another instance to introduce changes or ensure proper behavior. | Continuous Delivery Ecosystem Foundation, Site Reliability Engineering |
| Impediment | Anything that prevents a team member from performing work as efficiently as possible. | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation |
| Impediment (Scrum) | Anything that prevents a team member from performing work as efficiently as possible. | Agile Service Management, DevOps Foundation |
| Implementation Under Test | The EUT is a software implementation. E.g. Embedded program is being tested. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Improvement Kata | A structured way to create a culture of continuous learning and improvement. (In Japanese business, Kata is the idea of doing things the "correct" way. An organization's culture can be characterized as its Kata through its consistent role modeling, teaching and coaching.) | DevOps Foundation |
| Incentive model | A system designed to motivate people to complete tasks toward achieving objectives. The system may employ either positive or negative consequences for motivation. | DevSecOps Foundation |
| Incident | Any unplanned interruption to an IT service or reduction in the quality of an IT service. Includes events that disrupt or could disrupt the service. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |

| | | |
|------------------------------------|---|---|
| Incident Management | Process that restores normal service operation as quickly as possible to minimize business impact and ensure that agreed levels of service quality are maintained. (ITIL definition). Involves capturing the who, what, when of service incidents and the onward use of this data in ensuring service level objectives are being met. | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Incident Response | An organized approach to addressing and managing the aftermath of a security breach or attack (also known as an incident). The goal is to handle the situation in a way that limits damage and reduces recovery time and costs. | DevSecOps Foundation, Site Reliability Engineering |
| Increment | Potentially shippable completed work that is the outcome of a Sprint. | Certified Agile Service Manager, DevOps Foundation |
| Incremental Rollout | Incremental rollout means deploying many small, gradual changes to a service instead of a few large changes. Users are incrementally moved across to the new version of the service until eventually all users are moved across. Sometimes referred to by colored environments e.g. Blue/green deployment. | Site Reliability Engineering |
| Infrastructure | All of the hardware, software, networks, facilities, etc., required to develop, test, deliver, monitor and control or support IT services. The term IT infrastructure includes all of the information technology but not the associated people, processes and documentation. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |
| Infrastructure as Code | The practice of using code (scripts) to configure and manage infrastructure. | DevOps Foundation, DevSecOps Foundation |
| Infrastructure Test | The purpose of the test is to verify the framework for EUT operating. E.g. verify specific operating system utilities function as expected in the target environment. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Infrastructure-as-a-Service (IaaS) | On-demand access to a shared pool of configurable computing resources. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|--|---|---|
| Integrated development environment (IDE) | An integrated development environment (IDE) is a software suite that consolidates the basic tools developers need to write and test software. Typically, an IDE contains a code editor, a compiler or interpreter and a debugger that the developer accesses through a single graphical user interface (GUI). An IDE may be a standalone application, or it may be included as part of one or more existing and compatible applications. (TechTarget) | DevSecOps Foundation |
| Integrated development environment (IDE) 'lint' checks | Linting is the process of running a program that will analyze code for potential errors (e.g., formatting discrepancies, non-adherence to coding standards and conventions, logical errors). | DevSecOps Foundation |
| Internet of Things | A network of physical devices that connect to the internet and potentially to each other through web-based wireless services. | DevOps Foundation, DevSecOps Foundation |
| Internal Automation | Scripts and automation delivered as part of the service that is intended to reduce toil. | Site Reliability Engineering |
| INVEST | A mnemonic was created by Bill Wake as a reminder of the characteristics of a quality user story. | Certified Agile Service Manager |
| ISO 31000 | A family of standards that provide principles and generic guidelines on risk management. | DevSecOps Foundation |
| ISO/IEC 20000 | International standard for IT service management. ISO/IEC 20000 is used to audit and certify service management capabilities. | DevOps Foundation |
| Issue Management | A process for capturing, tracking, and resolving bugs and issues throughout the software development lifecycle. | DevSecOps Foundation |
| IT Infrastructure Library (ITIL) | Set of best practice publications for IT service management. Published in a series of five core books representing the stages of the IT service lifecycle which are: Service Strategy, Service Design, Service Transition, Service Operation and Continual Service Improvement. | Certified Agile Process Owner |
| IT Service | A service provided to a customer from an IT organization. | DevOps Foundation |
| IT Service Management (ITSM) | Implementation and management of quality IT services that meet the needs of the business. (ITIL definition) | Certified Agile Process Owner, Site Reliability Engineering |

| | | |
|---------------------------------|---|--|
| iTest | Tool licensed by Spirent Communications for creating automated test cases. | Continuous Testing Foundation |
| ITIL | Set of best practice publications for IT service management. Published in a series of five core books representing the stages of the IT service lifecycle which are: Service Strategy, Service Design, Service Transition, Service Operation and Continual Service Improvement. | Certified Agile Service Manager, DevOps Foundation, Site Reliability Engineering |
| Jenkins | Jenkins is a freeware tool. It is the most popular master automation framework tool, especially for continuous integration task automation. Jenkins task automation centers around timed processes. Many test tools and other tools offer plugins to simplify integration with Jenkins. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Kaizen | The practice of continuous improvement. | DevOps Foundation |
| Kanban | Method of work that pulls the flow of work through a process at a manageable pace. | Certified Agile Service Manager, DevOps Foundation |
| Kanban Board | Tool that helps teams organize, visualize and manage work. | DevOps Foundation |
| Karpman Drama Triangle | The drama triangle is a social model of human interaction. The triangle maps a type of destructive interaction that can occur between people in conflict. | DevOps Leader |
| Key Metrics | Something that is measured and reported upon to help manage a process, IT service or activity. | DevOps Foundation, DevOps Leader |
| Key Performance Indicator | Key metric used to measure the achievement of critical success factors. KPIs underpin critical success factors and are measured as a percentage. | Certified Agile Process Owner, Certified Agile Service Manager |
| Key Performance Indicator (KPI) | Key metric used to measure the achievement of critical success factors. KPIs underpin critical success factors and are measured as a percentage. (ITIL definition) | Certified Agile Service Manager, DevOps Foundation |
| Keywords-Based | Test cases are created using pre-defined names that reference programs useful for testing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Knowledge Management | Process that ensures the right information is delivered to the right place or person at the right time to enable an informed decision. | DevOps Foundation, DevSecOps Foundation |

| | | |
|--------------------------------|---|---|
| Known Error | Problem with a documented root cause and a workaround. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |
| Kolb's Learning Styles | David Kolb published his learning styles model in 1984; his experiential learning theory works on two levels: a four stage cycle of learning and four separate learning styles. | DevOps Leader |
| Kotter's Dual Operating System | John Kotter describes the need for a dual operating system that combines the entrepreneurial capability of a network with the organisational efficiency of traditional hierarchy. | DevOps Leader |
| Kubernetes | Kubernetes is an open-source container-orchestration system for automating application deployment, scaling, and management. It was originally designed by Google, and is now maintained by the Cloud Native Computing Foundation. | Site Reliability Engineering |
| Kubler-Ross Change Curve | Describes and predicts the stages of personal and organizational reaction to major changes. | DevOps Foundation |
| Lab-as-a-Service (LaaS) | Category of cloud computing services that provides a laboratory allowing customers to test applications without the complexity of building and maintaining the lab infrastructure. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Laloux (Culture Models) | Frederic Laloux created a model for understanding organizational culture. | DevSecOps Foundation |
| Latency | Latency is the delay incurred in communicating a message, the time a message spends "on the wire" between the initial request being received e.g. by a server and the response being recieved e.g. by a client. | Site Reliability Engineering |
| Laws of Systems Thinking | In his book 'The Fifth Discipline', Peter Senge outlines eleven laws will help the understanding of business systems and to identify behaviors for addressing complex business problems. | DevOps Leader |
| Lean | Production philosophy that focuses on reducing waste and improving the flow of processes to improve overall customer value. | DevOps Leader |
| Lean (adjective) | Spare, economical. Lacking richness or abundance. | DevOps Foundation, DevSecOps Foundation |

| | | |
|--------------------------|---|---|
| Lean (production) | Production philosophy that focuses on reducing waste and improving the flow of processes to improve overall customer value. | DevOps Foundation, DevSecOps Foundation |
| Lean Canvas | Lean Canvas is a 1-page business plan template. | DevOps Leader |
| Lean Enterprise | Organization that strategically applies the key ideas behind lean production across the enterprise. | DevOps Foundation, DevSecOps Foundation |
| Lean IT | Applying the key ideas behind lean production to the development and management of IT products and services. | DevOps Foundation, DevSecOps Foundation |
| Lean Manufacturing | Lean production philosophy derived mostly from the Toyota Production System. | DevOps Foundation, DevSecOps Foundation |
| Lean Product Development | Lean Product Development, or LPD, utilizes Lean principles to meet the challenges of Product Development. | DevOps Leader |
| Lean Six Sigma | Management approach that combines the concepts of Lean Manufacturing and Six Sigma by removing 'waste' and reducing 'defects'. | Certified Agile Process Owner |
| Lean Startup | A system for developing a business or product in the most efficient way possible to reduce the risk of failure. | DevOps Leader |
| Lean Thinking | The goal of lean thinking is to create more value for customers with fewer resources and less waste. Waste is considered any activity that does not add value to the process. | Certified Agile Service Manager |
| License Scanning | Tools, such as Blackduck and Synopsis, that check that licenses of your dependencies are compatible with your application, and approve or blacklist them. | Site Reliability Engineering |
| Little's Law | A theorem by John Little which states that the long-term average number L of customers in a stationary system is equal to the long-term average effective arrival rate λ multiplied by the average time W that a customer spends in the system. | DevOps Leader |
| LoadRunner | Tool used to test applications, measuring system behavior and performance under load. Licensed by HP. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|--------------------------------------|--|---|
| Log | Serialized report of details such as test activities and EUT console logs. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Log Management | The collective processes and policies used to administer and facilitate the generation, transmission, analysis, storage, archiving and ultimate disposal of the large volumes of log data created within an information system. | DevSecOps Foundation |
| Logging | The capture, aggregation and storage of all logs associated with system performance including, but not limited to, process calls, events, user data, responses, error and status codes. Logstash and Nagios are popular examples. | Site Reliability Engineering |
| Logic Bomb (Slag Code) | A string of malicious code used to cause harm to a system when the programmed conditions are met. | DevSecOps Foundation |
| Longevity Test | The purpose of the test is to determine if a complete system performs as expected over an extended period of time | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Machine Learning | Data analysis that uses algorithms that learn from data. | DevOps Foundation |
| Malware | A program designed to gain access to computer systems, normally for the benefit of some third party, without the user's permission | DevSecOps Foundation |
| Many-factor Authentication | The practice of using at least 2 factors for authentication. The two factors can be of the same class. | DevSecOps Foundation |
| Mean Time Between Deploys | Used to measure deployment frequency. | DevOps Foundation, DevSecOps Foundation |
| Mean Time Between Failures (MTBF) | Average time that a CI or IT service can perform its agreed function without interruption. Often used to measure reliability. Measured from when the CI or service starts working, until the time it fails (uptime). (ITIL definition) | DevOps Foundation, DevSecOps Foundation |
| Mean Time to Detect Incidents (MTTD) | Average time required to detect a failed component or device. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |

| | | |
|-------------------------------------|--|---|
| Mean Time to Discovery | How long a vulnerability or software bug/defect exists before it's identified. | DevSecOps Foundation |
| Mean Time to Patch | How long it takes to apply patches to environments once a vulnerability has been identified. | DevSecOps Foundation |
| Mean Time to Repair/Recover (MTTR) | Average time required to repair/recover a failed component or device. MTTR does not include the time required to recover or restore service. | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Mean Time to Restore Service (MTRS) | Used to measure time from when the CI or IT service fails until it is fully restored and delivering its normal functionality (downtime). Often used to measure maintainability. (ITIL definition). | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Mental Models | A mental model is an explanation of someone's thought process about how something works in the real world. | DevOps Leader |
| Merge | Action of integrating a software changes together into a software version management system. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Metric | Something that is measured and reported upon to help manage a process, IT service or activity. | DevOps Foundation, DevSecOps Foundation |
| Metrics | This is a class of terms relevant to measurements used to monitor the health of a product or infrastructure. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Microservices | A software architecture that is composed of smaller modules that interact through APIs and can be updated without affecting the entire system. | DevOps Foundation |
| Mindset | A person's usual attitude or mental state is their mindset. | DevOps Leader |
| Minimum Critical Activities | Activities that must be performed to provide evidence of compliance with a given process. | Certified Agile Process Owner |
| Minimum Viable Product | Most minimal version of a product that can be released and still provide enough value that people are willing to use it. | Certified Agile Service Manager, DevOps Foundation, DevOps Leader |

| | | |
|------------------------------------|--|---|
| Mock Object | Mock is a method/object that simulates the behavior of a real method/object in controlled ways. Mock objects are used in unit testing. Often a method under a test calls other external services or methods within it. These are called dependencies. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Model | Representation of a system, process, IT service, CI, etc. that is used to help understand or predict future behavior. In the context of processes, models represent pre-defined steps for handling specific types of transactions. | DevSecOps Foundation |
| Model-Based | Test cases are automatically derived from a model of the entity under test. Example tool: Tricentus | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Monitoring | The use of a hardware or software component to monitor the system resources and performance of a computer service. | Site Reliability Engineering |
| Monitoring Tools | Tools that allow IT organizations to identify specific issues of specific releases and to understand the impact on end-users. | DevOps Leader |
| Monolithic | A software system is called "monolithic" if it has a monolithic architecture, in which functionally distinguishable aspects (for example data input and output, data processing, error handling, and the user interface) are all interwoven, rather than containing architecturally separate components. | Continuous Delivery Ecosystem Foundation |
| Multi-factor Authentication | The practice of using 2 or more factors for authentication. Often used synonymously with 2-factor Authentication. | DevSecOps Foundation |
| Multi-cloud | Multi-cloud DevOps solutions provide on-demand multi-tenant access to development and test environments. | Continuous Delivery Ecosystem Foundation |
| Network Reliability Engineer (NRE) | Someone who applies a reliability engineering approach to measure and automate the reliability of networks. | Site Reliability Engineering |
| Neuroplasticity | Describes the ability of the brain to form and reorganize synaptic connections, especially in response to learning or experience or following injury. | DevOps Leader |
| Neuroscience | The study of the brain and nervous system. | DevOps Leader |

| | | |
|-----------------------------|--|---|
| Non-functional requirements | Requirements that specify criteria that can be used to judge the operation of a system, rather than specific behaviors or functions (e.g., availability, reliability, maintainability, supportability); qualities of a system. | DevOps Foundation |
| Non-functional tests | Defined as a type of service testing intending to check non-functional aspects such as performance, usability and reliability of a software service. | Site Reliability Engineering |
| Object Under Test (OUT) | The EUT is a software object or class of objects. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Objective | An aim or goal of a process. | Certified Agile Process Owner |
| Observability | Observability is focused on externalizing as much data as you can about the whole service allowing us to infer what the current state of that service is. | Site Reliability Engineering |
| On-call | Being on-call means someone being available during a set period of time, and being ready to respond to production incidents during that time with appropriate urgency. | Site Reliability Engineering |
| Open Source | Software that is distributed with its source code so that end user organizations and vendors can modify it for their own purposes. | DevOps Foundation, DevSecOps Foundation |
| Operational Level Agreement | Agreement between an IT service provider and another part of the same organization. (ITIL definition) | Certified Agile Process Owner |
| Operations (Ops) | Individuals involved in the daily operational activities needed to deploy and manage systems and services such as quality assurance analysts, release managers, system and network administrators, information security officers, IT operations specialists and service desk analysts. | Continuous Delivery Ecosystem Foundation |

| | | |
|-----------------------|--|---|
| Operations Management | Function that performs the daily activities needed to deliver and support IT services and the supporting IT infrastructure at the agreed levels. (ITIL) | DevSecOps Foundation |
| Ops | Individuals involved in the daily operational activities needed to deploy and manage systems and services such as quality assurance analysts, release managers, system and network administrators, information security officers, IT operations specialists and service desk analysts. | DevOps Foundation, DevSecOps Foundation |
| Orchestration | An approach to building automation that interfaces or "orchestrates" multiple tools together to form a toolchain. | DevOps Foundation, DevSecOps Foundation |
| Organization Culture | A system of shared values, assumptions, beliefs, and norms that unite the members of an organization. | DevOps Leader |
| Organization Model | For DevOps, an approach that models Spotify's Squad approach for organizing IT. | DevOps Leader |
| Organizational Change | Efforts to adapt the behavior of humans within an organization to meet new structures, processes or requirements. | DevOps Foundation, DevSecOps Foundation |
| OS Virtualization | A method for splitting a server into multiple partitions called "containers" or "virtual environments" in order to prevent applications from interfering with each other. | DevOps Foundation |
| Outcome | Intended or actual results. | DevOps Foundation, DevSecOps Foundation |
| Output | Deliverable produced by a process activity (e.g., information, plans, documents, records, reports and so forth). | Certified Agile Process Owner |
| Package Registry | A repository for software packages, artifacts and their corresponding metadata. Can store files produced by an organization itself or for third party binaries. Artifactory and Nexus are amongst the most popular. | Site Reliability Engineering |
| Pages | Something for creating supporting web pages automatically as part of a CI/CD pipeline. | Site Reliability Engineering |
| Patch | A software update designed to address (mitigate/remediate) a bug or weakness. | DevSecOps Foundation |

| | | |
|------------------------------|--|---|
| Patch management | The process of identifying and implementing patches. | DevSecOps Foundation |
| Pathological Culture | Pathological cultures tend to view information as a personal resource, to be used in political power struggles (Westrum). | DevOps Leader, Site Reliability Engineering |
| Penetration Testing | An authorized simulated attack on a computer system that looks for security weaknesses, potentially gaining access to the system's features and data. | DevSecOps Foundation |
| People Changes | Focuses on changing attitudes, behaviors, skills, or performance of employees. | DevOps Leader |
| Performance Test | The purpose of the test is to determine an EUT meets its system performance criterion or to determine what a system's performance capabilities are. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Plan | Formal, approved document that describes the capabilities and resources needed to achieve a result. | Certified Agile Process Owner |
| Plan-Do-Check-Act | A four-stage cycle for process management and improvement attributed to W. Edwards Deming. Sometimes called the Deming Cycle or PDCA. | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation, DevSecOps Foundation |
| Platform-as-a-Service (PaaS) | Category of cloud computing services that provides a platform allowing customers to develop, run, and manage applications without the complexity of building and maintaining the infrastructure. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Plugin | A pre-programmed integration between an Orchestration tool and other tools. For example, many tools offer plugins to integrate with Jenkins. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Policies | Formal documents that define boundaries in terms of what the organization may or may not do as part of its operations. | DevOps Foundation, DevSecOps Foundation |
| Policy | Formal document that describes the overall intentions and direction of a service provider, as expressed by senior management. | Certified Agile Process Owner |

| | | |
|------------------------------------|--|--|
| Policy as Code | The notion that security principles and concepts can be articulated in code (e.g., software, configuration management, automation) to a sufficient degree that the need for an extensive traditional policy framework is greatly reduced. Standards and guidelines should be implemented in code and configuration, automatically enforced and automatically reported-on in terms of compliance, variance or suspected violations. | DevSecOps Foundation |
| Post Implementation Review (PIR) | Review that takes place after a change or a project has been implemented that assesses whether the change was successful and opportunities for improvement. | Certified Agile Service Manager, DevOps Foundation |
| Potentially Shippable Product | Increment of work that is "done" and capable of being released if it makes sense to do so. | Certified Agile Service Manager, DevOps Foundation |
| Pre-Flight | This is a class of terms which refers names of activities and processes that are conducted on an EUT prior to integration into the trunk branch. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Priority | The relative importance of an incident, problem or change; based on impact and urgency. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |
| Privileged Access Management (PAM) | Technologies that help organizations provide secured privileged access to critical assets and meet compliance requirements by securing, managing and monitoring privileged accounts and access. (Gartner) | DevSecOps Foundation |
| Problem | The underlying cause of one or more incidents. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |
| Procedure | Step-by-step instructions that describe how to perform the activities in a process. | Certified Agile Service Manager |
| Process | Structured set of activities designed to accomplish a specific objective. A process takes inputs and turns them into defined outputs. Related work activities that take specific inputs and produce specific outputs that are of value to a customer. | Certified Agile Service Manager, DevOps Foundation, DevSecOps Foundation |
| Process Backlog | Prioritized list of everything that needs to be designed or improved for a process including current and future requirements. | Certified Agile Service Manager |

| | | |
|----------------------------|--|--|
| Process Changes | Focuses on changes to standard IT process, such as software development practices, ITIL processes, change management, approvals etc. | DevOps Leader |
| Process Customer | Recipient of a process' output. | Certified Agile Service Manager |
| Process Improvement Team | Team of individuals that designs or redesigns a process and determines how best to implement the new process across the organization. | Certified Agile Process Owner |
| Process Manager | Individual responsible for operational (day-to-day) management of a process. | Certified Agile Process Owner |
| Process Owner | Role accountable for the overall quality of a process. May be assigned to the same person who carries out the Process Manager role, but the two roles may be separate in larger organizations. (ITIL definition) | DevOps Foundation, DevSecOps Foundation, Certified Agile Service Manager |
| Process Owner | Person accountable for the overall quality of a process and the owner of the Process Backlog. | Certified Agile Service Manager |
| Process Planning Meeting | A high-level event to define the goals, objectives, inputs, outcomes, activities, stakeholders, tools and other aspects of a process. This meeting is not timeboxed. | Certified Agile Service Manager |
| Process Supplier | Creator of process input. | Certified Agile Service Manager |
| Processing Time | The period during which one or more inputs are transformed into a finished product by a manufacturing or development procedure. (Business Dictionary) | DevOps Leader |
| Product Backlog | Prioritized list of functional and non-functional requirements for a system usually expressed as user stories. | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation |
| Product Backlog Refinement | Ongoing process of adding detail, estimates and order to backlog items. Sometimes referred to as Product Backlog grooming. | Certified Agile Service Manager |
| Product Owner | An individual responsible for maximizing the value of a product and for managing the product backlog. Prioritizes, grooms, and owns the backlog. Gives the squad purpose. | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation, DevOps Leader |

| | | |
|-------------------------------|---|---|
| Programming-Based | Test cases are created by writing code in a programming language. E.g. JavaScript, Python, TCL, Ruby | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Project | Temporary endeavor undertaken to create a unique product, service or result. | Certified Agile Process Owner |
| Provision Platforms | Tools that provide platforms for provisioning infrastructure (e.g., Puppet, Chef, Salt). | DevOps Leader |
| Psychological Safety | Psychological safety is a shared belief that the team is safe for interpersonal risk taking. | DevOps Leader |
| QTP | Quick Test Professional is a functional and regression test automation tool for software applications. Licensed by HP. | Continuous Testing Foundation |
| Quality Management | Tools that handle test case planning, test execution, defect tracking (often into backlogs), severity and priority analysis. CA's Agile Central | Site Reliability Engineering |
| RACI Matrix | Maps roles and responsibilities to the activities of a process or project. | Certified Agile Process Owner |
| Ranorex | GUI test automation framework for testing of desktop, web-based and mobile applications. Licensed by Ranorex. | Continuous Testing Foundation |
| Ransomware | Encrypts the files on a user's device or a network's storage devices. To restore access to the encrypted files, the user must pay a "ransom" to the cybercriminals, typically through a tough-to-trace electronic payment method such as Bitcoin. | DevSecOps Foundation |
| Regression testing | The purpose of the test is to determine if a new version of an EUT has broken somethings that worked previously. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Regulatory compliance testing | The purpose of the test is to determine if an EUT conforms to specific regulatory requirements. E.g. verify an EUT satisfies government regulations for consumer credit card processing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Release | Software that is built, tested and deployed into the production environment. | Continuous Delivery Ecosystem Foundation, DevOps Foundation, DevSecOps Foundation |

| | | |
|-----------------------------|--|---|
| Release Acceptance Criteria | Measurable attributes for a release package which determine whether a release candidate is acceptable for deployment to customers. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Release Candidate | A release package that has been prepared for deployment, may or may not have passed the Release. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Release Governance | Release Governance is all about the controls and automation (security, compliance, or otherwise) that ensure your releases are managed in an auditable and trackable way, in order to meet the need of the business to understand what is changing. | Site Reliability Engineering |
| Release Management | Process that manages releases and underpins Continuous Delivery and the Deployment Pipeline. | DevOps Foundation, DevSecOps Foundation |
| Release Orchestration | Typically a deployment pipeline, used to detect any changes that will lead to problems in production. Orchestrating other tools will identify performance, security, or usability issues. Tools like Jenkins and Gitlab CI can "orchestrate" releases. | Site Reliability Engineering |
| Release Planning Meeting | Time-boxed event that establishes the goals, risks, features, functionality, delivery date and cost of a release. It also includes prioritizing the Product Backlog. | Certified Agile Process Owner, Certified Agile Service Manager |
| Relevance | A Continuous Testing tenet which emphasizes a preference to focus on the most important tests and test results | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Reliability | Measure of how long a service, component or CI can perform its agreed function without interruption. Usually measured as MTBF or MTBSI. (ITIL definition) | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Reliability Test | The purpose of the test is to determine if a complete system performs as expected under stressful and loaded conditions over an extended period of time. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Remediation | Action to resolve a problem found during DevOps processes. E.g. Roll-back changes for an EUT change that resulted in a CT a test case fail verdict. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Remediation Plan | Plan that determines the actions to take after a failed change or release. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |

| | | |
|----------------------------|---|---|
| Request for Change (RFC) | Formal proposal to make a change. The term RFC is often misused to mean a change record, or the change itself. (ITIL definition) | DevOps Foundation |
| Requirements Management | Tools than handle requirements definition, traceability, hierarchies & dependency. Often also handles code requirements and test cases for requirements. | Site Reliability Engineering |
| Resilience | Building an environment or organization that is tolerant to change and incidents. | DevSecOps Foundation, Site Reliability Engineering |
| Response Time | Response time is the total time it takes from when a user makes a request until they receive a response. | Site Reliability Engineering |
| REST | Representation State Transfer. Software architecture style of the world-wide web. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Restful API | Representational state transfer (REST) or RESTful services on a network, such as HTTP, provide scalable interoperability for requesting systems to quickly and reliably access and manipulate textual representations (XML, HTML, JSON) of resources using stateless operations (GET, POST, PUT, DELETE, etc.). | Continuous Delivery Ecosystem Foundation |
| RESTful interface testing | The purpose of the test is to determine if an API satisfies its design criterion and the expectations of the REST architecture. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Return on Investment (ROI) | Difference between the benefit achieved and the cost to achieve that benefit, expressed as a percentage. | DevOps Foundation, DevSecOps Foundation |
| Review Apps | Allow code to be committed and launched in real time – environments are spun up to allow developers to review their application. | Site Reliability Engineering |

| | | |
|----------------------------------|--|---|
| Rework | The time and effort required to correct defects (waste). | DevOps Leader |
| Risk | Possible event that could cause harm or loss or affect an organization's ability to achieve its objectives. The management of risk consists of three activities: identifying risks, analyzing risks and managing risks. The probably frequency and probable magnitude of future loss. Pertains to a possible event that could cause harm or loss or affect an organization's ability to execute or achieve its objectives. | DevOps Foundation, DevSecOps Foundation |
| Risk Event | Possible event that could cause harm or loss or affect an organization's ability to achieve its objectives. The management of risk consists of three activities: identifying risks, analyzing risks and managing risks. | DevOps Leader |
| Risk Management Process | The process by which "risk" is contextualized, assessed, and treated. From ISO 31000: 1) Establish context, 2) Assess risk, 3) Treat risk (remediate, reduce or accept). | DevSecOps Foundation |
| Robot Framework | TDD framework created and supported by Google. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Role | Set of responsibilities, activities and authorities granted to a person or team. A role is defined by a process. One person or team may have multiple roles. A set of permissions assigned to a user or group of users to allow a user to perform actions within a system or application. | DevOps Foundation, DevSecOps Foundation |
| Role-based Access Control (RBAC) | An approach to restricting system access to authorized users. | DevSecOps Foundation |
| Roll-back | Software changes which have been integrated are removed from the integration. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Root Cause Analysis (RCA) | Actions take to identify the underlying cause of a problem or incident. | DevOps Foundation, DevSecOps Foundation |
| Rugged Development (DevOps) | Rugged Development (DevOps) is a method that includes security practices as early in the continuous delivery pipeline as possible to increase cybersecurity, speed, and quality of releases beyond what DevOps practices can yield alone. | DevOps Foundation |

| | | |
|--|---|---|
| Rugged DevOps | Rugged DevOps is a method that includes security practices as early in the continuous delivery pipeline as possible to increase cybersecurity, speed, and quality of releases beyond what DevOps practices can yield alone. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Runbooks | A collection of procedures necessary for the smooth operation of a service. Previously manual in nature they are now usually automated with tools like Ansible. | Site Reliability Engineering |
| Runtime Application Self Protection (RASP) | Tools that actively monitor and block threats in the production environment before they can exploit vulnerabilities. | Site Reliability Engineering |
| Sanity Test | A very basic set of tests that determine if a software is functional at all. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Scalability | Scalability is a characteristic of a service that describes its capability to cope and perform under an increased or expanding load. | Site Reliability Engineering |
| Scaled Agile Framework (SAFE) | A proven, publicly available, framework for applying Lean-Agile principles and practices at an enterprise scale. | DevOps Foundation |
| SCARF Model | A summary of important discoveries from neuroscience about the way people interact socially. | DevOps Leader |
| Scheduling | Scheduling: the process of planning to release changes into production. | DevOps Leader |
| Scrum | A simple framework for effective team collaboration on complex projects. Scrum provides a small set of rules that create "just enough" structure for teams to be able to focus their innovation on solving what might otherwise be an insurmountable challenge. (Scrum.org) | Certified Agile Service Manager, DevOps Foundation |
| Scrum Artifacts | Product Backlog, Sprint Backlog, Burndown Chart, Product Increment | Certified Agile Process Owner |
| Scrum Components | Scrum's roles, events, artifacts and the rules that bind them together. | Certified Agile Service Manager |
| Scrum Events | Release Planning Meeting (optional), Sprint Planning Meeting, Sprint, Daily Scrum, Sprint Review, Sprint Retrospective | Certified Agile Process Owner |

| | | |
|---------------------------------|---|--|
| Scrum Guide | The definition of Scrum concepts and practices, written by Ken Schwaber and Jeff Sutherland. | Certified Agile Service Manager |
| Scrum Pillars | Pillars that uphold the Scrum framework that include: Transparency, Inspection and Adaption. | Certified Agile Process Owner |
| Scrum Roles | Product Owner, Development Team (Team) and ScrumMaster. See also Agile Service Management Roles. | Certified Agile Process Owner |
| Scrum Team | A self-organizing, cross-functional team that uses the Scrum framework to deliver products iteratively and incrementally. The Scrum Team consists of a Product Owner, the Development Team, and a Scrum Master. | DevOps Foundation |
| Scrum values | A set of fundamental values and qualities underpinning the Scrum framework: commitment, focus, openness, respect and courage. | Certified Agile Process Owner, Certified Agile Service Manager |
| ScrumMaster | An individual who provides process leadership for Scrum (i.e., ensures Scrum practices are understood and followed) and who supports the Scrum Team by removing impediments. | DevOps Foundation |
| Secret Detection | Secret Detection aims to prevent that sensitive information, like passwords, authentication tokens, and private keys are unintentionally leaked as part of the repository content. | Site Reliability Engineering |
| Secrets Management | Secrets management refers to the tools and methods for managing digital authentication credentials (secrets), including passwords, keys, APIs, and tokens for use in applications, services, privileged accounts and other sensitive parts of the IT ecosystem. | Site Reliability Engineering |
| Secure Automation | Secure automation removes the chance of human error (and wilful sabotage) by securing the tooling used across the delivery pipeline. | Site Reliability Engineering |
| Security (Information Security) | Practices intended to protect the confidentiality, integrity and availability of computer system data from those with malicious intentions. | DevOps Foundation, DevSecOps Foundation |
| Security as Code | Automating and building security into DevOps tools and practices, making it an essential part of tool chains and workflows. | DevOps Foundation, DevSecOps Foundation |

| | | |
|----------------------|---|---|
| Security tests | The purpose of the test is to determine if an EUT meets its security requirements. An example is a test that determines if an EUT processes login credentials properly. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Selenium | Popular open-source tool for software testing GUI and web applications. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Self-healing | Self-healing means the ability of services and underlying environments to detect and resolve problems automatically. It eliminates the need for manual human intervention. | Site Reliability Engineering |
| Self-organizing Team | Management principle in which a team chooses how best to accomplish their work, rather than being directed by others outside the team. Self-organization happens within boundaries and against given goals (i.e., what to do). | Certified Agile Process Owner |
| Self-organizing | The management principle that teams autonomously organize their work. Self-organization happens within boundaries and against given goals. Teams choose how best to accomplish their work, rather than being directed by others outside the team. | Certified Agile Service Manager |
| Serverless | A code execution paradigm where no underlying infrastructure or dependencies are needed, moreover a piece of code is executed by a service provider (typically cloud) who takes over the creation of the execution environment. Lambda functions in AWS and Azure Functions are examples. | Site Reliability Engineering |
| Service | Means of delivering value to customers by facilitating outcomes customers want to achieve without the ownership of specific costs and risks. | DevOps Foundation, DevSecOps Foundation |
| Service Catalog | Subset of the Service Portfolio that consists of services that are live or available for deployment. Has two aspects: The Business/Customer Service Catalog (visible to customers) and the Technical/Supporting Service Catalog. (ITIL definition) | DevOps Foundation |
| Service Design | One of the ITIL Core publications and a stage of the service lifecycle. | DevOps Foundation |

| | | |
|---------------------------------|--|--|
| Service Desk | Single point of contact between the service provider and the users. Tools like Service Now are used for managing the lifecycle of services as well as internal and external stakeholder engagement. | DevOps Foundation |
| Service Level Agreement (SLA) | Written agreement between an IT service provider and its customer(s) that defines key service targets and responsibilities of both parties. An SLA may cover multiple services or customers. (ITIL definition) | Certified Agile Process Owner, DevOps Foundation, Site Reliability Engineering |
| Service Level Indicator (SLI) | SLI's are used to communicate quantitative data about services, typically to measure how the service is performing against an SLO. | Site Reliability Engineering |
| Service Level Management | Process that ensures all current and planned IT services are delivered to agreed achievable targets. (ITIL definition) | Certified Agile Process Owner |
| Service Level Objective (SLO) | An SLO is a goal for how well a product or service should operate. SLO's are set based on what an organization is expecting from a service. | Site Reliability Engineering |
| Service Lifecycle | Structure of the ITIL Core guidance. | DevOps Foundation |
| Service Management | Set of specialized organizational capabilities for providing value to customers in the form of services. (ITIL definition) | DevOps Foundation |
| Service Management Office (SMO) | Function that coordinates all processes and functions that manage a service provider's services throughout their lifecycle. Process Owners may report directly or via a 'dotted' reporting line to the SMO. | Certified Agile Process Owner |
| Service Operation | One of the ITIL Core publications and a stage of the service lifecycle. | DevOps Foundation |
| Service Provider | Organization that supplies services to one or more internal or external customers. (ITIL definition) | DevOps Foundation |
| Service Request | User request for a standard service from an IT service provider. (ITIL definition) | DevOps Foundation |
| Service Strategy | One of the ITIL Core publications and a stage of the service lifecycle. | DevOps Foundation |
| Service Transition | One of the ITIL Core publications and a stage of the service lifecycle. | DevOps Foundation |

| | | |
|------------------------------------|---|---|
| Seven Pillars of DevOps | Seven distinct "pillars" provide a foundation for DevOps systems which include Collaborative Culture, Design for DevOps, Continuous Integration, Continuous Testing, Continuous Delivery and Deployment, Continuous Monitoring and Elastic Infrastructures and Tools. | Continuous Delivery Ecosystem Foundation |
| Shift Left | An approach that strives to build quality into the software development process by incorporating testing early and often. This notion extends to security architecture, hardening images, application security testing, and beyond. | DevOps Foundation, DevSecOps Foundation |
| SilkTest | Automated function and regression testing of enterprise applications. Licensed by Borland. | Continuous Testing Foundation |
| Simian Army | The Simian Army is a suite of failure-inducing tools designed by Netflix. The most famous example is Chaos Monkey which randomly terminates services in production as part of a Chaos Engineering approach. | Site Reliability Engineering |
| Single Point of Failure (SPOF) | A single point of failure (SPOF) is a part of a system that, if it fails, will stop the entire system from working. | DevOps Foundation |
| Site Reliability Engineering (SRE) | The discipline that incorporates aspects of software engineering and applies them to infrastructure and operations problems. The main goals are to create scalable and highly reliable software systems. | Site Reliability Engineering |
| Six Sigma | Disciplined, data-driven approach that focuses on reducing defects by measuring standard deviations from an expected norm. | Certified Agile Process Owner |
| SMART Goals | Specific, measurable, achievable, relevant and time-bound goals. | DevOps Foundation |
| Smoke Test | A basic set of functional tests that are run immediately after a software component is built. Same as CI Regression Test. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Snapshot | Report of pass/fail results for a specific build. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Snippets | Stored and shared code snippets to allow collaboration around specific pieces of code. Also allows code snippets to be used in other code-bases. BitBucket and GitLab allow this. | Site Reliability Engineering |

| | | |
|------------------------------------|---|--|
| SOAP | Simple Object Access Protocol (SOAP) is an XML-based messaging protocol for exchanging information among computers. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Software Composition Analysis | A tool that checks for libraries or functions in source code that have known vulnerabilities. | DevSecOps Foundation |
| Software Defined Networking (SDN) | Software-Defined Networking (SDN) is a network architecture approach that enables the network to be intelligently and centrally controlled, or 'programmed,' using software applications. | Site Reliability Engineering |
| Software Delivery Lifecycle (SDLC) | The process used to design, develop and test high quality software. | DevOps Leader, Site Reliability Engineering |
| Software Version Management System | A repository tool which is used to manage software changes. Examples are: Azure DevOps, BitBucket, Git, GitHub, GitLab, VSTS. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Software-as-a-Service (SaaS) | Category of cloud computing services in which software is licensed on a subscription basis. | DevOps Foundation, Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Source Code Tools | Repositories for controlling source code for key assets (application and infrastructure) as a single source of truth. | DevOps Foundation, DevOps Leader |
| Spotify Squad Model | An organizational model that helps teams in large organizations behave like startups and be nimble. | DevOps Foundation, DevOps Leader |
| Sprint | A period of 2-4 weeks during which an increment of product work is completed. | Certified Agile Process Owner, Certified Agile Service Manager, Continuous Delivery Ecosystem Foundation |
| Sprint (Scrum) | A time-boxed iteration of work during which an increment of product functionality is implemented. | DevOps Foundation |
| Sprint Backlog | Subset of the backlog that represents the work that must be completed to realize the Sprint Goal. | Certified Agile Process Owner, DevOps Foundation |
| Sprint Goal | Purpose and objective of a Sprint, often expressed as a business problem that is going to be solved. | Certified Agile Process Owner, Certified Agile Service Manager |

| | | |
|--|---|---|
| Sprint Planning Meeting | A 4 to 8-hour time-boxed event that defines the Sprint Goal, the increment of the Product Backlog that will be completed during the Sprint and how it will be completed. | Certified Agile Process Owner, Certified Agile Service Manager |
| Sprint Retrospective | A 1.5 to 3-hour time-boxed event during which the Team reviews the last Sprint and identifies and prioritizes improvements for the next Sprint. | Certified Agile Process Owner, Certified Agile Service Manager |
| Sprint Review | A time-boxed event of 4 hours or less where the Team and stakeholders inspect the work resulting from the Sprint and update the Product Backlog. | Certified Agile Process Owner, Certified Agile Service Manager |
| Spyware | Software that is installed in a computer without the user's knowledge and transmits information about the user's computer activities over back to the threat agent. | DevSecOps Foundation |
| Squads | A cross-functional, co-located, autonomous, self-directed team. | DevOps Leader |
| Stakeholder | Person who has an interest in an organization, project or IT service. Stakeholders may include customers, users and suppliers. (ITIL definition). | DevOps Foundation, DevSecOps Foundation |
| Stability | The sensitivity a service has to accept changes and the negative impact that may be caused by system changes. Services may have reliability, in that if functions over a long period of time, but may not be easy to change and so does not have stability. | Site Reliability Engineering |
| Standard Change | Pre-approved, low risk change that follows a procedure or work instruction. (ITIL definition) | DevOps Foundation, DevSecOps Foundation |
| Static Application Security Testing (SAST) | A type of testing that checks source code for bugs and weaknesses. | DevSecOps Foundation |
| Static Code Analysis | The purpose of the test is to detect source code logic errors and omissions such as memory leaks, unutilized variables, unutilized pointers. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Status Page | Service pages that easily communicate the status of services to customers and users. | Site Reliability Engineering |
| Sticks | Negative incentives, for discouraging or punishing undesired behaviors. | DevSecOps Foundation |

| | | |
|---------------------------------|--|---|
| Storage Security | A specialty area of security that is concerned with securing data storage systems and ecosystems and the data that resides on these systems. | Site Reliability Engineering |
| Stormstack | A commercial orchestration tool based on event triggers instead of time based. | Continuous Testing Foundation |
| StoStaKee | This stands for stop, start, and keep: this is an interactive time-boxed exercise focused on past events. | DevOps Leader |
| Strategic Sprint | A 2-4 week timeboxed Sprint during which strategic elements that were defined during the Process Planning Meeting are completed so that the Team can move on to designing the activities of the process. | Certified Agile Process Owner, Certified Agile Service Manager |
| Structural Changes | Changes in the hierarchy of authority, goals, structural characteristics, administrative procedures and management systems. | DevOps Leader |
| Supplier | External (third party) supplier, manufacturer or vendor responsible for supplying goods or services that are required to deliver IT services. | DevOps Foundation |
| Synthetic Monitoring | Synthetic monitoring (also known as active monitoring, or semantic monitoring) runs a subset of an application's automated tests against the system on a regular basis. The results are pushed into the monitoring service, which triggers alerts in case of failures. | Continuous Delivery Ecosystem Foundation |
| System of Record | A system of record is the authoritative data source for a data element or data entity. | DevOps Foundation, DevSecOps Foundation |
| System Test | The purpose of the test is to determine if a complete system performs as expected in its intended configurations. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| System Under Test (SUT) | The EUT is an entire system. E.g. Bank teller machine is being tested. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Tag-Based Test Selection Method | Tests and Code modules are pre-assigned tags. Tests are selected for a build matching pre-assigned tags. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Target Operating Model | A description of the desired state of the operating model of an organisation. | DevOps Leader |

| | | |
|---------------------------------|---|---|
| Teal Organization | An emerging organizational paradigm that advocates a level of consciousness including all previous world views within the operations of an organisation. | DevOps Leader |
| Team Dynamics | A measurement of how a team works together. Includes team culture, communication styles, decision making ability, trust between members, and the willingness of the team to change. | DevOps Leader |
| Techno-Economic Paradigm Shifts | Techno-economic paradigm shifts are at the core of general, innovation-based theory of economic and societal development as conceived by Carlota Perez. | DevOps Leader |
| Telemetry | Telemetry is the collection of measurements or other data at remote or inaccessible points and their automatic transmission to receiving equipment for monitoring. | Site Reliability Engineering |
| Test Architect | Person who has responsibility for defining the overall end-to-end test strategy for an EUT. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Artifact Repository | Database of files used for testing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Campaign | A test campaign may include one or more test sessions. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Case | Set of test steps together with data and configuration information. A test case has a specific purpose to test at least one attribute of the EUT. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Creation Methods | This is a class of test terms which refers to the methodology used to create test cases. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|-------------------------------|--|--|
| Test Driven Development (TDD) | <p>Test-driven development (TDD) is a software development process in which the developer writes a test before composing code. They then follow this process:</p> <ol style="list-style-type: none"> 1. Write the test 2. Run the test and any others that are relevant and see them fail 3. Write the code 4. Run test(s) 5. Refactor code if needed 6. Repeat <p>Unit level tests and/or application tests are created ahead of the code that is to be tested.</p> | Continuous Delivery Ecosystem Foundation, DevOps Foundation, Continuous Testing Foundation |
| Test Duration | The time it takes to run a test. E.g. # hours per test | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Environment | The test environment refers to the operating system (e.g. Linux, windows version etc.), configuration of software (e.g. parameter options), dynamic conditions (e.g. CPU and memory utilization) and physical environment (e.g. power, cooling) in which the tests are performed. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Fast | A CT tenet referring to accelerated testing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Framework | A set of processes, procedures, abstract concept and environment in which automated tests are designed and implemented. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Harness | A tool which enables the automation of tests. It refers to the system test drivers and other supporting tools that requires to execute tests. It provides stubs and drivers which are small programs that interact with the software under test. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Hierarchy | This is a class of terms describes the organization of tests into groups. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Methodology | This class of terms identifies the general methodology used by a test. Examples are White Box, Black Box | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|---------------------------|--|---|
| Test result repository | Database of test results. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Results Trend- based | A matrix of correlation factors correlates test cases and code modules according to test result (verdict). | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Roles | This class of terms identifies general roles and responsibilities for people relevant to testing. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Script | Automated test case. A single test script may be implemented one or more test cases depending on the data. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Selection Method | This class of terms refers to the method used to select tests to be executed on a version of an EUT. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Session | Set of one or more test suites that are run together on a single build at a specific time. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Suite | Set of test cases that are run together on a single build at a specific time. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Trend | History of verdicts. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Type | Class that indicates what the purpose of the test is. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Test Version | The version of files used to test a specific build. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Tester | Individual who has responsibility to test a system or service. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |

| | | |
|--------------------------------|---|---|
| Testing Tools | Tools that verify code quality before passing the build. | DevOps Leader |
| The Advice Process | Any person deciding must seek advice from everyone meaningfully affected by the decision and people with expertise in the matter. Advice received must be taken into consideration, though it does not have to be accepted or followed. The objective of the advice process is not to form consensus, but to inform the decision-maker so that they can make the best decision possible. Failure to follow the advice process undermines trust and unnecessarily introduces risk to the business. | DevSecOps Foundation |
| The Checkbox Trap | The situation wherein an audit-centric perspective focuses exclusively on "checking the box" on compliance requirements without consideration for overall security objectives. | DevSecOps Foundation |
| The Power of TED | The Power of TED* offers an alternative to the Karpman Drama Triangle with its roles of Victim, Persecutor, and Rescuer. The Empowerment Dynamic (TED) provides the antidote roles of Creator, Challenger and Coach and a more positive approach to life's challenges. | DevOps Leader |
| The Three Ways | Key principles of DevOps – Flow, Feedback, Continuous experimentation and learning. | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Theory of Constraints | Methodology for identifying the most important limiting factor (i.e., constraint) that stands in the way of achieving a goal and then systematically improving that constraint until it is no longer the limiting factor. | DevOps Foundation, DevSecOps Foundation |
| Thomas Kilmann Inventory (TKI) | Measures a person's behavioral choices under certain conflict situations. | DevOps Foundation |
| Threat Agent | An actor, human or automated, that acts against a system with intent to harm or compromise that system. Sometimes also called a "Threat Actor." | DevSecOps Foundation |
| Threat Detection | Refers to the ability to detect, report, and support the ability to respond to attacks. Intrusion detection systems and denial-of-service systems allow for some level of threat detection and prevention. | |

| | | |
|---------------------|---|---|
| Threat Intelligence | Information pertaining to the nature of a threat or the actions a threat may be known to be perpetrating. May also include "indicators of compromise" related to a given threat's actions, as well as a "course of action" describing how to remediate the given threat action. | DevSecOps Foundation |
| Threat Modeling | A method that ranks and models potential threats so that the risk can be understood and mitigated in the context of the value of the application(s) to which they pertain. | DevSecOps Foundation |
| Time to Market | The period of time between when an idea is conceived and when it is available to customers. | DevOps Leader |
| Time to Value | Measure of the time it takes for the business to realize value from a feature or service. | DevOps Foundation, DevSecOps Foundation |
| Time Tracking | Tools that allow for time to be tracked, either against individual issues or other work or project types. | Site Reliability Engineering |
| Time-box | Maximum duration of a Scrum event. | Certified Agile Process Owner, Certified Agile Service Manager |
| Toil | A kind of work tied to running a production service that tends to be manual, repetitive, automatable, tactical, devoid of enduring value. | Site Reliability Engineering |
| Tool | This class describes tools that orchestrate, automate, simulate and monitor EUT's and infrastructures. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Toolchain | A philosophy that involves using an integrated set of complimentary task specific tools to automate an end to end process (vs. a single-vendor solution). | DevOps Foundation |
| Touch Time | In a Lean Production system the The touch time is the time that the product is actually being worked on, and value is being added. | DevOps Leader |
| Tracing | Tracing provides insight into the performance and health of a deployed application, tracking each function or microservice which handles a given request. | Site Reliability Engineering |
| Traffic Volume | The amount of data sent and received by visitors to a service (e.g. a website or API). | Site Reliability Engineering |

| | | |
|---|---|---|
| Training From the Back of the Room | An accelerated learning model in line with agile values and principles using the 4Cs instructional design "map" (Connection, Concept, Concrete Practice, Conclusion). | |
| Transformational Leadership | A leadership model in which leaders inspire and motivate followers to achieve higher performance by appealing to their values and sense of purpose, facilitating wide-scale organizational change (State of DevOps Report, 2017). | DevOps Leader |
| Tribe Lead | A senior technical leader that has broad and deep technical expertise across all the squads' technical areas. A group of squads working together on a common feature set, product or service is a tribe in Spotify's definitions. | DevOps Leader |
| Tribes | A collection of squads with a long-term mission that work on/in a related business capability. | DevOps Leader |
| Trojan (horses) | Malware that carries out malicious operations under the appearance of a desired operation such as playing an online game. A Trojan horse differs from a virus because the Trojan binds itself to non-executable files, such as image files, audio files whereas a virus requires an executable file to operate. | DevSecOps Foundation |
| Trunk | The primary source code integration repository for a software product. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Unit Test | The purpose of the test is to verify code logic. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Usability Test | The purpose of the test is to determine if humans have a satisfactory experience when using an EUT. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| User | Consumer of IT services. Or, the identity asserted during authentication (aka username). | DevOps Foundation, DevSecOps Foundation |
| User and Entity Behavior Analytics (UEBA) | A machine learning technique to analyze normal and "abnormal" user behaviour with the aim of preventing the latter. | Site Reliability Engineering |

| | | |
|-------------------------|--|---|
| User Story | Statement written from the user's business perspective that describes how the user will achieve a goal from a feature of the product. User stories are captured in the Product Backlog (or Process Backlog). | Certified Agile Process Owner, Certified Agile Service Manager |
| Value Added Time | The amount of time spent on an activity that creates value (e.g., development, testing). | DevOps Leader |
| Value Efficiency | Being able to produce value with the minimum amount of time and resources. | DevOps Leader |
| Value Stream | All of the activities to go from a customer request to a delivered product or service. | DevOps Foundation |
| Value Stream Mapping | Lean tool that depicts the flow of information, materials and work across functional silos with an emphasis on quantifying waste, including time and quality. | DevOps Foundation |
| Value Stream Management | The ability to visualize the flow of value delivery through the DevOps lifecycle. Gitlab CI and the Jenkins extension (from Cloud Bees) DevOptics can provide this visualization. | Site Reliability Engineering |
| Value Stream Owner | Individual accountable to senior management for improving the value to non-value ratio of a given product or service. | Certified Agile Process Owner |
| Variable Speed IT | An approach where traditional and digital processes co-exist within an organization while moving at their own speed. | DevOps Foundation |
| Velocity | Measure of the quantity of work done in a pre-defined interval. The amount of work an individual or team can complete in a given amount of time. | DevOps Foundation, DevSecOps Foundation, Site Reliability Engineering |
| Verdict | Test result classified as Fail, Pass or Inconclusive. | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Version control tools | Ensure a 'single source of truth' and enable change control and tracking for all production artifacts. | DevOps Foundation |
| Vertical Scaling | Computing resources are scaled higher to increase processing speed e.g. using faster computers to run more tasks faster. | Continuous Testing Foundation |

| | | |
|--------------------------------|--|--|
| Virus (Computer) | Malicious executable code attached to a file that spreads when an infected file is passed from system to system that could be harmless (but annoying) or it could modify or delete data. | DevSecOps Foundation |
| Voice of the Customer (VOC) | A process that captures and analyzes customer requirements and feedback to understand what the customer wants. | DevOps Foundation |
| Vulnerability | A weakness in a design, system, or application that can be exploited by an attacker. | DevSecOps Foundation |
| Vulnerability Intelligence | Information describing a known vulnerability, including affected software by version, relative severity of the vulnerability (for example, does it result in escalation of privileges for user role, or does it cause a denial of service), exploitability of the vulnerability (how easy/hard it is to exploit), and sometimes current rate of exploitation in the wild (is it being actively exploited or is it just theoretical). This information will also often include guidance on what software versions are known to have remediated the described vulnerability. | DevSecOps Foundation |
| Vulnerability management | The process of identifying and remediating vulnerabilities. | DevSecOps Foundation |
| Wait Time | The amount of time wasted on waiting for work (e.g., waiting for development and test infrastructure, waiting for resources, waiting for management approval). | DevOps Leader |
| Waste (Lean Manufacturing) | Any activity that does not add value to a process, product or service. | Certified Agile Process Owner, Certified Agile Service Manager, DevOps Foundation, DevOps Leader |
| Water-scrum-fall | A hybrid approach to application lifecycle management that combines waterfall and Scrum development can complete in a given amount of time. | Continuous Delivery Ecosystem Foundation |
| Waterfall (Project Management) | Linear and sequential approach to managing software design and development projects in which progress is seen as flowing steadily (and sequentially) downwards (like a waterfall). | Certified Agile Service Manager, Continuous Delivery Ecosystem Foundation, DevOps Foundation |

| | | |
|--|--|---|
| Weakness | An error in software that can be exploited by an attacker to compromise the application, system, or the data contained therein. Also called a vulnerability. | DevSecOps Foundation |
| Web Application Firewall (WAF) | Tools that examine traffic being sent to an application and can block anything that looks malicious. | Site Reliability Engineering |
| Web IDE | Tools that have a web client integrated development environment. Enables developer productivity without having to use a local development tool. | Site Reliability Engineering |
| Westrum (Organization Types) | Ron Westrum developed a typology of organizational cultures that includes three types of organizations: Pathological (power-oriented), Bureaucratic (rule-oriented) and Generative (performance-oriented). | DevSecOps Foundation, Site Reliability Engineering |
| White-Box Testing (or Clear-, Glass-, Transparent-Box Testing or Structural Testing) | Test cases use extensive knowledge of the internal design structure or workings of an application, as opposed to its functionality (i.e. Black-Box Testing). | Continuous Delivery Ecosystem Foundation, Continuous Testing Foundation |
| Whitelisting | Application whitelisting is the practice of specifying an index of approved software applications that are permitted to be present and active on a computer system. | Continuous Delivery Ecosystem Foundation |
| Wicked Questions | Wicked questions are used to expose the assumptions which shape our actions and choices. They are questions that articulate the embedded, and often contradictory assumptions, we hold about an issue, a problem or a context. | DevOps Leader |
| Wiki | Knowledge sharing can be enabled by using tools like Confluence which create a rich Wiki of content | Site Reliability Engineering |
| Wilber's Quadrants | A model that recognises four modes of general approach for human beings. Two axes are used: on one axis people tend towards individuality OR collectivity. | DevOps Leader |
| Work in Progress (WIP) | Any work that has been started but has not been completed. | DevOps Foundation |
| Workaround | Temporary way to reduce or eliminate the impact of incidents or problems. May be logged as a known error in the Known Error Database. (ITIL definition). | DevOps Foundation, DevSecOps Foundation |

| | | |
|------------------|--|----------------------|
| World Café | Is a structured conversational process for knowledge sharing in which groups of people discuss a topic at several tables, with individuals switching tables periodically and getting introduced to the previous discussion at their new table by a "table host". | DevOps Leader |
| Worms (Computer) | Worms replicate themselves on a system by attaching themselves to different files and looking for pathways between computers. They usually slow down networks and can run by themselves (where viruses need a host program to run). | DevSecOps Foundation |

DevOps Foundation Course: Value Added Resources

This document provides links to articles and videos related to the DevOps Foundation course from DevOps Institute. This information is provided to enhance your understanding of DevOps Foundation-related concepts and terms and is not examinable. Of course, there is a wealth of other videos, blogs and case studies on the web. We welcome suggestions for additions.

Videos Featured in the Course

| Module Featured | Title & Link |
|---|--|
| 1: Exploring DevOps | 'A Short History of DevOps' with Damon Edwards (11:47) |
| 1: Exploring DevOps | Abbreviated version of Simon Sinek's Ted Talk 'Start with Why - How Great Leaders Inspire Action' (5:00) |
| 2: Core DevOps Practices | 'Gene Kim Defines The Three Ways of The Phoenix Project' (3:31) |
| 3: Key DevOps Principles | 'GitHub Professional Guide: Continuous Integration & Continuous Delivery' (6:00) |
| 4: Business & Technology Frameworks | 'Spotify Engineering Culture Part 1' with Henrik Kniberg (13:12) |
| 5: DevOps Values: Culture, Behaviors & Operating Models | 'Spotify Engineering Culture Part 2' with Henrik Kniberg (13:27) |
| 6: DevOps Values: Automation & Architecting DevOps Toolchains | 'The DevOps Toolchain' with John Okoro (7:43) |
| 7: DevOps Values: Measurement, Metrics & Reporting | 'Double the Awesome' with Dr. Nicole Forsgren (21:46) |
| 8: DevOps Values: Sharing, Shadowing & Evolving | 'DevOps: A Culture of Sharing' with Gareth Rushgrove (2:19) |

DevOps Reports

| Report & Link | Writers/Publishers |

DevOps
INSTITUTE

DevOps Foundation v3.3

Egzamin próbny 1

1. Mała grupka osób wróciła niedawno z konferencji, gdzie dowiedziała się o DevOpsie. Nie mogą uzgodnić, jak zacząć. Od czego organizacja IT powinna rozpocząć stosowanie praktyk DevOps?

- A. Zrozumienie celu istnienia organizacji
- B. Wybranie odpowiednich aplikacji do projektu pilotażowego
- C. Opracowanie długoterminowej strategii
- D. Zidentyfikowanie potrzebnych narzędzi i szkoleń

2. Czym są Trzy Drogi?

- A. Metoda identyfikowania i usuwania ograniczeń
- B. Kluczowe zasady DevOps
- C. Metodyczne, oparte na danych podejście do ograniczania marnotrawstw
- D. Metoda ciągłego doskonalenia

3. Które stwierdzenie o Kanban jest PRAWIDŁOWE?

- A. Pcha (push) pracę przez cały proces
- B. Wymaga narzędzia do zarządzania przepływem pracy
- C. Ciągnie (pull) pracę przez cały proces
- D. Umożliwia więcej pracy w toku

4. Czym jest Manifest Programowania Zwinnego?

- A. Wartości i zasady kierujące iteracyjnym i zorientowanym na ludzi podejściem do tworzenia oprogramowania
- B. Metoda, która koncentruje się na upewnianiu się, że oprogramowanie jest gotowe do wdrożenia przez cały cykl życia
- C. Deklaracja korzyści i zamiarów DevOps
- D. Intencje i motywy bycia zwinnym przedsiębiorstwem

5. Organizacja stara się walczyć z wyzwaniami swojej tradycyjnej kultury silosów, w której zespoły zostały zorganizowane wokół wiedzy merytorycznej. Na co cierpi ta organizacja?

- A. Dług kulturowy
- B. Zmęczenie zmianą
- C. Zmiana organizacyjna
- D. Niski poziom zaufania

6. Które stwierdzenie NAJLEPIEJ opisuje zmęczenie zmianą?

- A. Agresywny opór
- B. Apatia
- C. Wskazywanie palcem i szukanie winnych
- D. Wyczerpanie

7. Ze względu na ściśle powiązaną architekturę organizacja nie jest w stanie zwiększyć częstotliwości wydań kluczowej usługi. Kolejne wydania niosą zazwyczaj wiele problemów, w wyniku czego przewaga konkurencyjna organizacji maleje. Jakie podejście do tworzenia oprogramowania można zastosować by poprawić sytuację?

- A. Rozwój oparty na testach
- B. Kontenery
- C. Mikro-serwisy
- D. Chaos Monkey

8. Organizacja właśnie zakończyła wdrożenie pilota usługi przy użyciu praktyk DevOps i wstępnego procesu wdrażania. Która z poniższych metryk dostarczy organizacji najwięcej informacji i pomoże w ciągłym doskonaleniu?

- A. Średni czas naprawy (MTTR)
- B. Czasy realizacji (lead time) zmian i czas cyklu (cycle time) zmian
- C. Dzielenie się wiedzą
- D. Wszystkie powyższe

9. Które stwierdzenie o zespołach DevOps jest NAJBARDZIEJ trafne?

- A. Odpowiadają za ustanowienie praktyk DevOps w całym przedsiębiorstwie
- B. Są odpowiedzialne za rozwój procesu wdrażania
- C. Powinny to być stałe zespoły współpracujące przy długoterminowych projektach
- D. Powinny dzielić się odpowiedzialnością

10. Organizacja niedawno zorganizowała wewnętrzne Dni DevOps. Podczas jednej z otwartych sesji zasugerowano, że istnieje więcej możliwości dla deweloperów, operacji, bezpieczeństwa i pozostałych obszarów IT do interakcji i dzielenia się wiedzą. Które z poniższych działań powinna rozważyć organizacja?

- A. Hackatony
- B. Symulacje
- C. Możliwość immersji
- D. Wszystkie z powyższych

11. Które z poniższych ról są interesariuszami DevOps?

- A. Testerzy
- B. Specjaliści do spraw wsparcia
- C. Dostawcy zewnętrzni
- D. Wszystkie z powyższych

12. Co NIE jest celem DevOps?

- A. Większa produktywność
- B. Mniejsza liczba wydań oprogramowania, ale o wyższej jakości
- C. Wdrażanie oprogramowania o niższym ryzyku
- D. Lepsza jakość kodu

13. Organizacja wdraża aplikację powodującą zakłócenia działania podobną do Simian Army. Którą z Trzech Dróg wprowadzają?

- A. Pierwszą drogę
- B. Drugą drogę
- C. Trzecią drogę
- D. Projekt Feniks

14. Organizacja chce poprawić współpracę zespołów w czasie rzeczywistym. Którą praktykę DevOps powinni wziąć pod uwagę?

- A. Kanban
- B. ChatOps
- C. Eskalacje
- D. Powiadomienia

15. Co charakteryzuje kulturę DevOps?

- A. Skuteczna jedno-kierunkowa komunikacja od góry organizacji do dołu
- B. Docenienie sukcesów najlepszych i najbystrzejszych pracowników
- C. Wspólna wizja, cele i zachęty
- D. Wszystkie z powyższych

16. Który opis NAJLEPIEJ charakteryzuje proces wdrażania?

- A. Zautomatyzowana wersja procesu zarządzania zmianami ITSM
- B. Zautomatyzowany proces zarządzania zmianami oprogramowania od zatwierdzenia zmian kodu do wydania
- C. Zbiór narzędzi umożliwiających ciągłą integrację
- D. Sekwencja działań dodających wartość wymaganych do zaprojektowania, zbudowania i dostarczenia produktu

17. Na ostatniej konferencji CIO dowiedział się, że jego organizacja powinna poważnie zainwestować w uczenie maszynowe. Po powrocie do biura poprosił jednego ze swoich kierowników o przygotowanie uzasadnienia biznesowego dla takiej inwestycji. Która z poniższych propozycji NIE jest bezpośrednią korzyścią, którą organizacja mogłaby uzyskać z zastosowania sztucznej inteligencji, a zatem należy ją wykluczyć z inwestycji?

- A. Prognozowanie przyszłych scenariuszy zdarzeń
- B. Znajdowanie nowych trendów i korelacji
- C. Zwiększenie wkładu człowieka i zwiększenie produktywności
- D. Budowanie kultury wolnej od obwiniania

18. Które stwierdzenie dotyczące Improvement Kata jest PRAWIDŁOWE?

- A. Koncentruje się na krótkoterminowych celach
- B. Jest to 7-etapowy proces
- C. Uwzględnia długoterminową wizję lub kierunki działania organizacji
- D. Metoda powinna być realizowana w miarę dostępnego czasu

19. W kontekście zwinnego tworzenia oprogramowania, które z poniższych działań NIE jest obowiązkiem operacji IT?

- A. Zarządzanie backlogiem produktu
- B. Definiowanie wymagań нефункциональных
- C. Identyfikacja wymagań bezpieczeństwa
- D. Zapewnienie dostępu do infrastruktury

20. Która z poniższych cech charakteryzuje kulturę organizacyjną o wysokim zaufaniu?

- A. Dobry przepływ informacji
- B. Interdyscyplinarna współpraca
- C. Uczenie się na porażkach i nowych pomysłach
- D. Wszystkie z powyższych

21. Dlaczego kultura organizacyjna jest kluczowym czynnikiem sukcesu DevOps?

- A. Reprezentuje wartości i zachowania, które przyczyniają się do stworzenia wyjątkowego środowiska społecznego i psychologicznego organizacji
- B. Reprezentuje podejście dowodzenia i kontroli w zakresie świadczenia usług
- C. Reprezentuje sposób, w jaki organizacja jest ustrukturyzowana i zorganizowana
- D. Odzwierciedla strategiczny kierunek przywództwa firmy

22. Jaka jest podstawowa zaleta łańcuchów narzędzi DevOps (DevOps toolchains)?

- A. Automatyzują kroki w procesie wdrażania
- B. Pozwalają śledzić podróż funkcjonalności od pomysłu do wdrożenia
- C. Zapewniają, że ich projekt architektoniczny wspiera interoperacyjność i spójność
- D. Wszystkie z powyższych

23. Która z poniższych ról DevOps NIE została jeszcze dobrze zdefiniowana?

- A. Inżynier systemów
- B. Architekt ds. automatyzacji ciągłego dostarczania
- C. Inżynier DevOps
- D. Ekspert ds. doświadczeń użytkownika

24. Organizacja wdraża DevOps. Deweloperzy obawiają się, że ich procesy ITSM są zbyt złożone, powolne i nie będą wspierać zasad i praktyk DevOps. Która z poniższych metod pomoże organizacji zaszczyć podejście zwinne w istniejących procesach ITSM?

- A. ITIL
- B. Agile
- C. Agile service management
- D. Lean

25. Które z narzędzi Lean przedstawia przepływ informacji, materiałów i pracy pomiędzy funkcjonalnymi silosami kładąc nacisk na identyfikację i eliminację marnotrawstw?

- A. Improvement Kata
- B. Ciągłe dostarczanie
- C. Kanban
- D. Mapowanie strumienia wartości

26. Biznesowe „dlaczego” z koncepcji Złotego Kręgu reprezentuje...

- A. Cel, przyczynę i przekonania organizacji
- B. Produkty i usługi organizacji
- C. Przewagę konkurencyjną organizacji
- D. Rentowność organizacji

27. Co decyduje o tym, które zasady i praktyki DevOps przyniosą NAJLEPSZE korzyści dla organizacji?

- A. Strategie i cele biznesowe
- B. Zaangażowanie wczesnych użytkowników (early adopters)
- C. Dostępność zaawansowanych narzędzi
- D. Możliwości i zasoby IT

28. Którą z Trzech Dróg wspiera Teoria Ograniczeń?

- A. Pierwszą drogę
- B. Drugą drogę
- C. Trzecią drogę
- D. Wszystkie z powyższych

29. Który z poniższych elementów jest wymagany do ciągłej integracji?

- A. Zautomatyzowane testy jednostkowe, integracyjne i akceptacyjne
- B. Zautomatyzowane zarządzanie wydaniem
- C. Proces ciągłego dostarczania
- D. Proces wdrażania

30. Która z praktyk DevOps opiera się na procesie wdrażania, który umożliwia wdrażanie na żądanie?

- A. Ciągłe testowanie
- B. Ciągła integracja
- C. DevSecOps
- D. Ciągłe dostarczanie

31. Który z poniższych procesów ITSM ma największe znaczenie dla DevOps?

- A. Zarządzanie zmianami organizacyjnymi
- B. Zarządzanie ciągłością działania usług
- C. Zarządzanie incydentami
- D. Wszystkie z powyższych

32. W organizacji stwierdzono kulturę obwiniania i strachu, w której incydenty nie są cenione, a porażki nie są traktowane jako szansa na naukę. Zidentyfikowano wiele pojedynczych punktów awarii (SPOFs), a pracownicy cierpią każdego dnia z powodu kruchości (fragility) systemów i konieczności udziału w bolesnych analizach (war rooms) w trakcie licznych awarii. Które z poniższych podejść powinna przyjąć organizacja, by poprawić sytuację?

- A. Kultura bezpieczeństwa
- B. Zwinne wytwarzanie oprogramowania
- C. Budowanie łańcucha narzędzi DevOps
- D. Site Reliability Engineering

33. Kto powinien zostać zaangażowany w planowanie i służyć jako agent zmiany podczas próby wprowadzenia w organizacji poważnej zmiany?

- A. Wcześni użytkownicy (early adopters)
- B. Konserwatyści i pesymiści
- C. Kierownictwo
- D. Ludzie potrzebujący dowodów

34. Który z poniższych NIE jest typowym elementem łańcucha narzędzi DevOps (DevOps toolchain)?

- A. Narzędzia monitorowania
- B. Zautomatyzowane testy
- C. Kontrola wersji
- D. Systemy zarządzania incydentami w Service Desku

35. Która z poniższych propozycji jest kluczowym czynnikiem sukcesu DevOps?

- A. Ustanowienie łańcucha narzędzi
- B. Zatrudnienie inżynierów DevOps
- C. Zaangażowanie kierownictwa w zmianę kultury
- D. Automatyzacja wszystkiego

36. Które z poniższych działań nie jest celem przywództwa DevOps?

- A. Pomoc w poprawie auto-diagnozy
- B. Kontrola i ocena pracowników za pomocą metryk
- C. Wpojenie ludziom konieczności samodoskonalenia
- D. Przełożenie lokalnych spostrzeżeń na globalne ulepszenia

37. Która z Trzech Dróg zachęca do wzajemnej oceny (peer review) zmian w kodzie produkcyjnym?

- A. Pierwsza droga
- B. Druga droga
- C. Trzecia droga
- D. Wszystkie z powyższych

38. Co oznacza pojęcie „shift left”?

- A. Wbudowanie jakości w proces tworzenia oprogramowania poprzez wczesne i ciągłe testowanie
- B. Przekazywanie pakietów wersji oprogramowania do operacji IT od razu po zakończeniu partii (batch) pracy programistycznej
- C. Wykonywanie losowych testów kodu wgrywanych na serwer ciągłej integracji
- D. Przeprowadzanie większej ilości testów produkcyjnych po wdrożeniu

39. Organizacja ma problem z dodatkowym czasem potrzebnym na weryfikację bezpieczeństwa po ukończeniu sprintu. Opóźnienie wpływa na zdolność organizacji do tworzenia wydań. Organizacja chce zwiększyć liczbę testów bezpieczeństwa w ramach podejścia „shift left” w swoich testach. Jakiej praktyki DevOps będzie potrzebować organizacja?

- A. ChatOps
- B. Ciągłe testowanie
- C. DevSecOps
- D. Powiadomienia o podatnościach

40. Organizacja przygotowuje się do automatycznego wdrożenia każdej wersji, która przejdzie automatyczne testy jednostkowe, integracyjne, akceptacyjne użytkowników i niefunkcjonalne. Którą z praktyk DevOps zamierza zastosować ta organizacja?

- A. Ciągłe dostarczanie
- B. Ciągłe testowanie
- C. Ciągłe wdrażanie
- D. Ciągła integracja

KLUCZ ODPOWIEDZI

DevOps
INSTITUTE

DevOps Foundation v3.3

Egzamin próbny 2

1. Która z poniższych propozycji jest dobrym przykładem metryki DevOps stosowanej do mierzenia Pierwszej Drogi, czyli przepływu?

- A. Wyniki kompilacji kodu/ testu
- B. Rejestr hipotez
- C. Wskaźnik niepowodzenia zmian
- D. Czas cyklu zmian

2. Według raportów Accelerate State of DevOps, organizacje zaliczane do elity...

- A. Wdrażają częściej
- B. Mają wyższy wskaźnik niepowodzeń zmian
- C. Mają dłuższy MTTR
- D. Wydłużają czas realizacji od zatwierdzenia zmian kodu do wdrożenia

3. Które z poniższych stwierdzeń poprawnie opisuje Trzecią Drogę?

- A. Zrozumienie i zwiększenie przepływu pracy
- B. Tworzenie kultury sprzyjającej eksperymentom
- C. Tworzenie krótszych pętli informacji zwrotnej w celu ciągłego doskonalenia
- D. Zrozumienie, że powtarzanie czynności nie prowadzi do mistrzostwa

4. Która z poniższych cech jest metryką DevOps odnoszącą się do stabilności?

- A. Zaangażowanie i morale
- B. Czas realizacji zmiany i czas cyklu
- C. Incydenty i defekty
- D. Średni czas do wykrycia incydentów (MTTD) Średni czas do wykrycia incydentów (MTTD)

5. Które z poniższych wartości są przedstawione w Manifeście Zwinnego Oprogramowania?

- A. Procesy i narzędzia ponad ludzi i interakcje
- B. Szczegółowa dokumentacja ponad działające oprogramowanie
- C. Współpraca z klientem ponad negocjowanie umów
- D. Realizacja założonego planu ponad reagowanie na zmiany

6. W jaki sposób DevOps poprawia zwinność?

- A. Tworzy więcej silosów
- B. Zwiększa ograniczenia
- C. Stosuje zasady zwinnego tworzenia oprogramowania zarówno do Dev, jak i Ops
- D. Wdraża szybciej z większą liczbą błędów

7. Które z poniższych działań NIE jest częścią Improvement Kata?

- A. Zaplanowanie ostatnich kroków
- B. Ustalenie obecnego stanu
- C. Zastosowanie PDCA do osiągnięcia kolejnego stanu docelowego
- D. Zrozumienie długoterminowego kierunku

8. Szef Ewy wrócił właśnie z konferencji nt. Agile i DevOps. Poprosił Ewę o poprowadzenie programu transformacji DevOps i rozpoczęcie od utworzenia zespołu DevOps. Dlaczego Ewa powinna zachować ostrożność realizując to zadanie?

- A. Istnieje ryzyko, że zespół może stać się kolejnym silosem
- B. Ten zespół może promować DevOps w całej organizacji
- C. Ludzie zrozumieją, że DevOps to zadanie dla wszystkich osób
- D. Daje to Ewie możliwość zapewnienia współdzielenia odpowiedzialności

9. Adam buduje nowy, autonomiczny zespół z wieloma kompetencjami, który będzie zajmował się produktem z przewidywanym długim cyklem życia. Wyciąga członków zespołu z różnych działów, w których dotychczas odpowiadali za różne procesy. To będzie pierwsze wspólne działanie nowego zespołu. W jaki sposób zespół może zacząć ze sobą współdziałać wizualizując cały cykl życia produktu?

- A. Przeprowadzić hakaton z ludźmi z różnych działów
- B. Stworzyć forum dyskusyjne dla klientów
- C. Użyć ChatOps do monitorowania wydajności produktu
- D. Wykonać ćwiczenie mapowania strumienia wartości

10. Który z poniższych mierników koncentruje się przede wszystkim na stabilności?

- A. Czas realizacji zmiany
- B. Wskaźnik powodzenia wdrożeń
- C. Średni czas do przywrócenia działania systemu
- D. Częstotliwość wdrażania

11. Anna wraz ze swoim zespołem produktowym zakończyła ćwiczenie mapowania strumienia wartości. Udało się im zidentyfikować szereg ograniczeń w procesie. Jednym z nich jest zdolność zespołu bezpieczeństwa do szybkiego reagowania na ich wnioski. Które z poniższych zagadnień pomoże Annie i jej zespołowi znaleźć praktyki, które złagodzą wspomniane ograniczenie?

- A. Kanban
- B. Site Reliability Engineering
- C. Chaos engineering
- D. DevSecOps

12. Który z poniższych czynników NIE jest pozytywnie skorelowany z wydajnością organizacji?

- A. Rozwój oprogramowania oparty o główne repozytorium
- B. Złożony proces zarządzania zmianami
- C. Luźno powiązana architektura
- D. Korzystanie z chmury obliczeniowej

13. Jaki jest cel Pierwszej Drogi?

- A. Zwiększenie przepływu pracy
- B. Pozwolenie na przekazanie znanych błędów w dół procesu wytwórczego
- C. Pozwolenie by lokalna optymalizacja spowodowała globalną degradację
- D. Zrozumienie i dodanie ograniczeń

14. Zespół Anny składa się ze zdalnych pracowników zatrudnionych przez firmę, dla której pracuje oraz przez organizację partnerską z Indii. Rzadko zdarza się, aby więcej niż dwie osoby z jej zespołu znajdowały się jednocześnie w tym samym miejscu. Ostatnio zespół Anny miał problemy ze stabilnością systemu, które wymagały dodatkowego wsparcia od jeszcze innego zespołu zajmującego się infrastrukturą. Wspólnie stwierdzili, że coraz trudniej jest im współpracować w formie telekonferencji, ponieważ nie wiedzą co inni robią i muszą czekać, aby dowiedzieć się, jaki wpływ na ich systemy mają wprowadzone zmiany. Co może im pomóc lepiej zarządzać incydentami?

- A. Narzędzia do zarządzania wydajnością aplikacji
- B. ChatOps
- C. Eskalacje
- D. Jenkins

15. W czym może pomóc automatyzacja w DevOps?

- A. Szybszy czas realizacji
- B. Mniej chaotyczne wydania oprogramowania
- C. Szybsze przywracanie system po awarii
- D. Wszystkie z powyższych

16. Które z poniższych stwierdzeń jest prawdziwe w przypadku łańcuchów narzędzi DevOps?

- A. Narzędzia muszą pochodzić od tego samego dostawcy
- B. Są zbudowane wyłącznie w oparciu o systemy komercyjne
- C. Nie wymagają projektu architektonicznego, aby zapewnić interoperacyjność
- D. Narzędzia powinny być połączone, zwykle za pośrednictwem API

17. Sophia jest dyrektorem zarządzającym w firmie doradczej. Jest rozczarowana tym, że jej konsultanci wydają się mniej zainteresowani marką i celem jej organizacji niż markami i celami firm, dla których świadczą usługi doradcze. Zaprosiła więc swoich konsultantów na oficjalną kolację, aby o tym porozmawiać, ale większość odmówiła, powołując się na zobowiązania rodzinne lub problemy z dotarciem na miejsce. Sophia nie lubi organizować spotkań w godzinach pracy, ponieważ nie chce zabierać konsultantom płatnych godzin. Co Sophia tworzy w swojej organizacji poprzez takie zachowanie?

- A. Dług techniczny
- B. Dług kulturowy
- C. Wysoki poziom zaufania
- D. Kulturę ścisłej współpracy

18. Która z poniższych cech jest charakterystyczna dla kultury DevOps?

- A. Zorientowanie na wykonywanie zadań
- B. Zadowolenie
- C. Odporność
- D. Wysoki poziom zaufania

19. David odkrywa, że ilekroć spotyka się z Robertem, kłócą się o to, co należy zrobić dla poprawy pracy w ich zespole. Wie, że oboje chcą tego, co najlepsze dla ich zespołu, ale widzi też, że napięcia między nimi wpływają na pozostałych członków zespołu do tego stopnia, że przestają angażować się w rozmowy na temat poprawy sposobu ich wspólnej pracy. Jakiej metody mógłby użyć David by zrozumieć, jak lepiej pracować z Robertem?

- A. Test na konflikty Thomasa-Kilmanna
- B. Trzy Drogi
- C. Krzywa zmian Kübler-Rossa
- D. Tablica Kanban

20. Co sprawia, że kultura DevOps jest teraz tak ważna?

- A. Duże przedsiębiorstwa mają konkurencję w postaci zwinnych startupów
- B. Konsumenci mają mentalność „aplikacyjną” i adekwatne wymagania
- C. Czas na realizację wartości (time to value) musi przyspieszyć
- D. Wszystkie z powyższych

21. Które z poniższych stwierdzeń jest prawdziwe w odniesieniu do teorii ograniczeń?

- A. Każdy proces ma co najmniej jedno ograniczenie
- B. Wydajność procesu może przekroczyć wydajność jego ograniczeń
- C. Proces może być bardziej skuteczny niż jego najsłabsze ogniwo
- D. Poprawa ograniczeń jest jedynym sposobem na poprawę procesu

22. Która z poniższych odpowiedzi NIE jest typowym ograniczeniem?

- A. Luźno powiązana architektura
- B. Audyty bezpieczeństwa
- C. Testowanie konfiguracji i uruchamianie aplikacji
- D. Tworzenie środowiska aplikacyjnego

23. Która z poniższych propozycji jest przykładem pętli informacji zwrotnej?

- A. Dashbordy
- B. Rotacyjne dyżury operacyjne
- C. Logi produkcyjne
- D. Wszystkie z powyższych

24. W trakcie mapowania strumienia wartości, Sandra i jej zespół stwierdzili, że ich proces wdrażania zmian z wieloma radami ds. zmian, zakłóca i spowalnia przepływ pracy. Członkowie zespołu przeczytali też najnowszy raport o stanie DevOps i zauważyli, że złożone procesy zmian negatywnie wpływają na wydajność organizacji. Co mogłoby pomóc zespołowi Sandry w zbudowaniu lżejszego procesu zarządzania zmianami?

- A. ITIL
- B. Agile
- C. Agile service management
- D. Lean

25. Dlaczego mniej rzeczy psuje się na produkcji, kiedy stosujesz podejście „shift left”?

- A. Robienie wszystkiego z góry zmniejsza ilość pracy do wykonania później
- B. Szczegółowe planowanie daje pewność, że pomyśleliśmy o wszystkim
- C. Problemy są wykrywane i rozwiązywane wcześniej
- D. Stwierdzenie jest nieprawdziwe, zamiast tego powinniśmy stosować podejście „shift right”

26. Które z poniższych jest przykładem marnotrawstwa nazywanego „nadmiernym transportem”?

- A. Awarie i znane błędy
- B. Częste przekazywanie zadań pomiędzy zespołami, wiele e-maili i spotkań
- C. Nieużywane oprogramowanie lub infrastruktura
- D. Nadmiernie skomplikowana inżynieria

27. Co jest prawdą w zmienianiu kultury organizacji?

- A. Nie możesz zmienić ludzi; tylko oni sami mogą się zmienić
- B. Nie musisz angażować interesariuszy
- C. To nie kosztuje tyle, ile myślisz, że będzie kosztować
- D. Ludzie akceptują zmiany, nawet jeśli w nich nie uczestniczą

28. Manuel czytał o DevOpsie i uważa, że to podejście może zmienić na lepsze sposób pracy w jego organizacji. Zaczął rozmawiać o tym z ludźmi i znalazł kilka zainteresowanych osób. Myśli o przygotowaniu program wdrożenia i nauki. Dlaczego powinien to zrobić?

- A. Może przyciągnąć uwagę CEO
- B. Prawdopodobnie pojawią się inni innowatorzy i wczesni użytkownicy (early adopters)
- C. Nie powinien się tym zbytnio przejmować – i tak nikt nie będzie zainteresowany
- D. Jeśli do programu dołączy tzw. późna większość, będzie wiedział, że DevOps już działa

29. Lider transformacji...

- A. Akceptuje status quo
- B. Krytykuje zespół
- C. Dowodzi i strofuje
- D. Rozumie kierunek działania organizacji

30. Co powinniśmy mierzyć, gdy stosujemy zasady i praktyki DevOps, w celu poprawy wydajności organizacji?

- A. Dojrzałość
- B. Indywidualną wydajność pracowników
- C. Produktywność
- D. Wartość

31. Co powinien zrobić poprawiając automatyzację?

- A. Zautomatyzować wszystkie procesy, takie jak są
- B. Zacząć od architektury
- C. Zbudować swój zestaw narzędzi i trzymać się go
- D. Nie przejmować się monitorowaniem

32. Jakie są dobre sposoby na wzmocnienie nowych zachowań?

- A. Hackatony
- B. Dzielenie się historiami i pomysłami w stylu mediów społecznościowych
- C. Społeczności praktyków
- D. Wszystkie z powyższych

33. Która z poniższych cech NIE pasuje do kultury bezpieczeństwa?

- A. Analiza post-mortem bez obwiniania się
- B. Docenianie wartości incydentów na produkcji
- C. Akceptacja istnienia SPOFs
- D. Andon

34. Co sprawia, że Kanban jest użyteczny?

- A. Pozwala na nieograniczoną ilość pracy w toku
- B. Pcha pracę do zespołów
- C. Maksymalizuje marnotrawstwa i czas bezczynności
- D. Sprawia, że praca jest widoczna

35. Kiedy pracujesz nad poprawą stabilności, stosując zasady i praktyki DevOps, co musisz poświęcić?

- A. Szybkość
- B. Jakość
- C. Nic nie poświęcasz
- D. Swoich pracowników

36. DevOps to przede wszystkim...

- A. Ruch kulturowy
- B. Automatyzacja absolutnie wszystkiego
- C. Rozszerzenie podejścia Agile
- D. Koncept prosty do zrozumienia i wykonania

37. Która z poniższych propozycji nie jest jedną z czterech kluczowych metryk w DevOps?

- A. Częstotliwość wdrażania
- B. Czas realizacji od zatwierdzenia zmian w kodzie do testów
- C. Czas przywrócenia działania systemu po incydencie
- D. Wskaźnik niepowodzenia zmian

38. Liam stosuje zwinne praktyki, aby usprawnić przepływ pracy swojego zespołu. Zbliżył też do siebie osoby zajmujące się programowaniem oraz operacje IT. Korzystając z kombinacji możliwości ciągłego dostarczania i monitorowania, stworzył szybkie pętle informacji zwrotnej od klientów do swojego zespołu. Teraz chce przyspieszyć proces wdrażania innowacji. Którą z Trzech Dróg powinien się zainteresować?

- A. Pierwszą drogą
- B. Drugą drogą
- C. Trzecią drogą
- D. Wszystkimi z powyższych

39. Ciągłe dostarczanie...

- A. Zapewnia szybką i automatyczną informację zwrotną na temat gotowości systemu do wydania
- B. Daje pierwszeństwo pracy nad nowymi funkcjonalnościami przed utrzymaniem gotowości oprogramowania do wydania/ wdrożenia
- C. Opiera się na procesie wdrażania, który automatycznie wdraża na żądanie
- D. Zwiększa koszt, czas i ryzyko wprowadzania zmian przyrostowych

40. John od jakiegoś czasu zmienia swoją organizację zgodnie z podejściem DevOps. Obecnie skupia się na konsolidacji zysków, aby móc wprowadzać więcej zmian. Czego NIE powinien teraz robić?

- A. Komunikować sukcesu
- B. Milczeć o awariach i niepowodzeniach
- C. Ciągłe inwestować w edukację
- D. Udostępniać re-używalne artefakty

KLUCZ ODPOWIEDZI

| Pytanie | Poprawna odpowiedź | Obszar tematyczny |
|---------|--------------------|--|
| 1 | D | 7: DevOps Values: Measurements, Metrics & Reporting |
| 2 | A | 1: Exploring DevOps |
| 3 | B | 2: Core DevOps Principles |
| 4 | C | 2: Core DevOps Principles |
| 5 | C | 4: DevOps Values: Business & Technology Frameworks |
